ABSTRACTS

REPORT

TO

The Right Honourable SIR GEORGE GREY, Bart., G.C.B., Her Majesty's Principal Secretary of State for the Home Department, &c. &c. &c.

General Register Office,
10th December 1855.

SIR,

I HAVE the honour to submit to you the detailed Abstracts of the Marriages, Births, and Deaths that have been registered in England and Wales during the year 1853.

329,040 persons married, 612,391 children were born alive, 421,097 persons died, and were registered; so that 1,362,528 names have been added to the lists of those already on the public registers.

The natural increase of population by the excess of births over deaths was 191,294, and probably still more, as all the births are not registered in the present state of the law.

The immigrations from Scotland, Ireland, and foreign parts have added a certain number of persons to the population; while by emigration an equal, or perhaps a greater, number has been removed. The ascertained English emigrants from the ports of the United Kingdom amounted to 62,915, the Scotch to 22,605, the Irish to 192,609, the Foreigners to 31,459; and the nativity of 20,349 emigrants was undetermined.* Of the 62,915 English emigrants, 32,163 sailed to the Australian colonies, 26,496 to the United States, and 4194 only to our flourishing North American Colonies, where the soil and climate are adapted to develope all the vigour of the British race. which suffers in so many ways from the insalubrity of the Southern States of North America.

TABLE I.—Estimated POPULATION, Number of MARRIAGES, BIRTHS, and DEATHS registered in England in each Year from 1838 to 1853.

Years ended Dec. 31st.	Estimated POPULATION in England in the Middle of the Years.*	MARRIAGES.	PERSONS <i>Married.</i>	BIRTHS (exclusive of Still-born).	DEATHS.	Excess of Births over Deaths.
1838	15,312,256	118067	236134	463787	342760	121027
1839	15,515,296	123166	243332	492574	338984	153590
1840	15,721,029	122665	245330	502303	359687	142616
1841	15,929,492	122496	244992	512158	343447	168311
1842	16,123,793	118825	237650	517739	349519	168220
1843	16,320,479	123818	247636	527325	346445	180880
1844	16,519,565	132249	264498	540763	356933	183830
1845	16,721,081	143743	287486	543521	349366	194155
1846	16,925,051	145664	291328	572625	390315	182310
1847	17,131,512	135845	271690	539965	423304	116661
1848	17,340,492	138230	276460	563059	399833	163226
1849	17,552,020	141883	283766	578159	440839	137320
1850	17,766,129	152744	305488	593422	368995	224427
1851	17,982,849	154206	308412	615865	395396	220469
1852	18,205,627	158782	317564	624012	407135	216877
1853	18,403,313	164520	329040	612391	421097	191294

* The Population has been deduced on the assumption that the annual rate of increase was uniform; viz. 1.220 per cent. in each of the 10 years 1841-51, and 1.326 per cent. in each of the 3 years 1838-40. For 1852 and 1853 the increase of Population has been obtained by taking the excess of births over deaths in the four quarters ending June 30th, in each year. The results, by the latter method, will probably be found now to be more correct than those deduced on the hypothesis that the population increased at the same rate in 1851-2-3, as it did in 1841-51.

The temperature of the year at Greenwich was 1·7° below the average ; and the price of wheat rose from 44s. 6d. a quarter in the spring to 69s. 10d. in the last three months of the year. The rate of marriage was such, that to every 1000 persons living, 18 (or more exactly 17·88) married ; while the average proportion is 16. The births were at the rate of 33 in 1000 people living ; slightly above the average number, but less than in the two previous years. The mortality of the year was at the rate of 22·88 in 1000 living, which is somewhat above the average ; the excess of deaths in winter, spring, and autumn slightly exceeding the defect of deaths in summer. (Tables I., II.)

MARRIAGES.

164,520 marriages were celebrated in the year ; 138,042 or 84 per cent. according to the rites of the established church, and 26,478 or 16 per cent. *not* according to the rites of the established church. 20,632 marriages were by licence, 109,166 after banns, and 3814 on superintendent registrar's certificate ; in 4430 cases, it is not stated whether the marriage was after banns or licence or on Superintendent Registrar's certificate. Of the marriages in the established church *one* in 6·7 is by licence. The marriages in the Roman catholic chapels are rapidly increasing ; the number in 1844 was 2280, in 1849 it was 4199, and in 1853 it reached to 8375. The marriages in the registered places of other Christian denominations increased in the same period from 6284 to 10,149. The marriages in the offices of the Superintendent Registrars were 2064 in 1841 ; 3446 in 1844 ; 6813 in 1851 ; and 7598 in 1853. 68 marriages were performed according to the forms of the Quakers ; 288 according to the Jewish rites. The Quakers appear to be stationary, the Jews to be rapidly increasing, in England : the marriages of the Jews have doubled since 1841. (Table III.)

Marriages of Minors.—9131 men and 29,219 women married under the age of 21 years ; of men the proportion who married under age was 5·55, of women 17·76 in 100. The proportion of early marriages is rapidly increasing ; thus 4·38 of 100 men who married in 1841, and 5·55 of 100 men who married in 1853, were *minors* ; and out of the same number of women who married 13·29 were minors in 1841, and 17·76 in 1853.

The age of marriage has considerable influence on the manners of families, as well as on the numbers, the characters, and the vigour of children ; and it is curious to observe how widely the practice of different counties varies. Thus in Bedfordshire 10·54 in 100 men, and 22·90 in

Mean .	·813	1·626	3·261	2·238	123	62	31	45

NOTE.—The Table may be read thus :— In the year 1838 to every 100 persons living there were ·771 marriages or 1·542 persons married, 3·029 births, 2·238 deaths ; the number of persons living to every marriage, person married, birth or death, was 130, 65, 33, and 45 respectively. By disregarding the decimal points the Table will show the proportion to every 100,000 persons living. A correction for increase of population has been made in calculating the above results.

100 women, in Staffordshire out of the same numbers 9·05 men and 27·82 women, who married in 1853, were minors; the proportions in Northumberland were 3·44 men, and 14·03 women; in North Wales 3·13 men and 10·88 women. The straw-plait and lace manufactures in the South Midland Counties apparently promote early marriages by affording employment to children and to young people. In 11 counties the *minors* exceeded the proportion of 20 in 100 *women* married; namely in Warwick 21, Bucks 21, Northampton 22, Cambridge 22, Hertford 22, Essex 22, Bedford 23, Durham 24, Huntingdon 25, West Riding 25, Stafford 28.

Re-marriages.—22,358 widowers, and 14,758 widows married; 142,162 bachelors, and 149,762 spinsters married in the year. Of 100 men married, 14 had been married before, of 100 women 9 had been previously married. The proportion of widowers re-married was greatest, (16) in Cheshire, and least (9) in Westmorland. The proportion of widows was greatest (11·14) in Berks, least (3·5) in Rutland.

Signatures of persons married.—49,983 husbands and 72,204 wives, signed the marriage register with marks; 114,537 husbands and 92,316 wives wrote their names. Thus 30·4 in 100 men, and 43·9 in 100 women did not write their names.

The proportion in 100 persons (or 50 males and 50 females) was 40·8 in 1841, and 37·2 in 1853; so that the proportion of men and women signing with marks has decreased 1-11th part in twelve years.

1853	-	-	-	-	135023	7139	14739	7619	22358	14758	9181	29219	49983	72204	37345	47497

69·6 in 100 men and 56·1 in 100 women wrote their names ; but the proportions varied in different counties from 49·3 men in Monmouthshire and 49·6 men in Hertfordshire, to 85·4 men in Westmorland ; from 32·9 women in South Wales, 38·7 women in Lancashire, 44·0 women in Bedfordshire, to 75·2 women in Westmorland, and Surrey out of London.

The men (87·3) and women (77·7) who are married in London write their names in the largest proportions ; the men and women of Wales (and Monmouthshire) write their names in the lowest proportions. The men and women who marry in London are frequently of country birth ; but it is probable that the mere fact of going to London implies in this class a higher degree of education than the average prevailing in their native counties. The Welsh would probably be better instructed in writing if they learnt the English language in infancy.

The *ten* counties in which the greatest proportion of men wrote their names are : Durham 72·1, Gloucester 72·2, Lincoln 72·8, Devon 73·6, Sussex 73·8, York (East Riding) 77·5, Northumberland 79·2, York (North Riding) 79·4, Cumberland 82·9, Westmorland 85·4.

The system of instruction and the habits of these people must be very different from those of the people in the ten following English counties, where instruction is at the lowest ebb : Cambridgeshire 60·6, Shropshire 58·5, Buckinghamshire 58·4, Norfolk 58·1, Essex 57·5, Suffolk 56·5, Bedfordshire 55·7, Staffordshire 53·8, Huntingdonshire 51·9, Hertfordshire 49·6.

Thus in parts of England, the educational system of the country has been so narrowly based, and is so imperfect, that 5 in *ten* of the men who marry, cannot write their names.

It may be here useful to inquire, of what value is this test ? as by some it has been misunderstood, and by others mis-stated.

164,520 men, of whom about *five-sevenths* were of the age 20–30, and the same number of women, of whom *five-sevenths* were also of the same age, and the rest younger or older, went through the various marriage ceremonies in the established churches, in the chapels of protestant dissenters, in the Roman catholic chapels, in the meeting houses of various kinds, and in the register offices. At the end of the ceremony the young husband and wife are invited in all cases to sign the register book, in the presence of the officiating minister or the registrar ; they having the option, if they cannot write, to sign by making a *mark* against their names.

The parties are not asked whether in their own opinion they can or can not write, but are asked to *write their names* on an important occasion,

* The proportion of Widowers and Widows in the Year 1841 is for the September and December quarters only.

when on many accounts it is desirable that they should append their names, in their own handwriting, to a public register. The abstracts which have appeared in my reports, show how many men and how many women under these circumstances *do sign with marks*.

Two questions are raised on these signatures: Is the man or the woman who signs with a mark unable to write? Are the men or the women who write their names, able to write anything else? Some men and women who can write imperfectly, do undoubtedly sign with marks. Upon the

other hand, some persons can write their names, who cannot write a letter or keep an account in writing. The former class is perhaps the most numerous. Some of the 30 men, some of the 44 women, who sign with marks *can* write their names. Some of the 70 men and the 56 women who write their names, write little else; and are evidently unpractised writers, as their signatures are often almost illegible; not the flourishes of penmanship in which some men conceal the letters of their name, nor the undecipherable scrawl in which others write, but the uncouth, ill-formed letters of men and women who have never advanced at school beyond the first rudiments.

NOTE.—The above numbers are for the Counties *proper*, and not for the “Registration Counties.”

Looking at both sides of the question, the obvious inference is, I believe, correct; and we have practically 49,983 young men, and 72,204 young women unable to write, out of 164,520 of each sex who married, and will be the fathers and mothers of the next generation of English men and English women.

Of these persons unable to write, it is known that large numbers are unable to read.

On the hypothesis that the numbers who can write in the ordinary sense of the word are understated or are overstated, the test is still available for purposes of comparison; as the timidity which prevents some men and women from writing their names, or the vanity which prompts others to try who can scarcely put letters together, must be almost equally powerful in the several counties of England. These disturbing causes leave the important fact unexplained, that in *ten* counties from 15 to 28 men, and in ten other counties from 39 to 50 men, in 100, sign with marks when they are required to write their names.

The value of this test is also questioned upon the ground that it is, in itself, no proof of education; and it must be at once admitted that at the utmost it shows only how many out of a given number can or cannot write. Many of the men and women who cannot now write, as in the days of old when barons and knights signed with marks, possess great intelligence and have acquired many useful arts; so thousands, on the other hand, who read and write, are ill educated, and know nothing of those liberal arts and sciences which enlarge, refresh, and invigorate the mind as the sunshine and showers fertilize and adorn the soil of England.

Yet reading and writing are no unimportant acquirements. They are the gates of the temple of learning, and open at once access to many of its most delightful courts, where the mind can range freely among the creations of man and the inspirations of God. They are useful to him in his business, and they facilitate in a wonderful and new way his communications with his fellow men. What a striking difference would there be between two nations, the one consisting of people who could all when they married read and write, the other of people who could not read and write! The men of the latter nation would derive no advantage from the great discovery of printing, nor from the earlier and still greater discovery of the art of writing; that is, of transmitting the ideas of man to man through the sense of sight as well as through the sense of hearing by the voice. They could only converse with their equals in ignorance and capacity in their immediate neighbourhood; while the men of the favoured nation, who could read and write, could call into their chamber at will some of the loftiest spirits of the present and of past ages; they could converse with the apostles and the prophets, with the poets and the historians of their own country, in health and in sickness, in the hours of joy and of sadness—in the “valley of the shadow of death” itself.

One of these nations we have still amongst us; we see them in the unobtrusive figures of the marriage muster interspersed all over the land, in every county and parish, still in the dark, or receiving only feeble rays of the reflected light that irradiates our path. In the same year 612,391 children were born. Under the present system a large proportion of these children, and of the children born year after year, will evidently grow up in some counties without receiving adequate instruction, unless efforts are made at once to extend education in the most benighted counties. Why should 61 in 100 children in Lancashire and Staffordshire, 56 in Bedfordshire, grow up into womanhood unable to write, when only 25 in 100 marry ignorant of this art in Surrey (extra Metropolitan) and in Westmorland?

This question can be easily, but very unsatisfactorily, answered by referring to the occupations of the children. The precise circumstances of the nation among us that cannot write should be ascertained, as well as

the means we have at our disposal for rendering them the aid which every man would be glad to render, who by the accident of birth or by some other accident of nature is able to write himself. It will probably be found that different agencies may be applicable in the northern, southern, and midland counties; but it is already evident that the great work of the education of the whole people cannot be carried out until a system of schools and colleges, easily accessible to all, becomes virtually one of the great institutions of the country.

In fine, the arguments that the marriage registers supply in favour of the extension of education cannot be set aside by a few stories about

3·328 per cent. on the population ; the average rate being 3·261, and the rate of the preceding year, the highest on record, 3·428.

313,756 boys and 298,635 girls were born in the year ; the proportion of the numbers was 1·051 to 1·000, or nearly 105 to 100 = 21 boys to 20 girls.

There were to 100 girls, 108·3 boys born in Rutland, 108·2 in Hertford, 108·1 in the North Riding of Yorkshire, 107·8 in Devonshire. In these counties the boys abounded ; and in every county the number of boys exceeded the number of girls. But in Nottingham and Dorset the excess of boys was less than 1 in 100.

These proportions undergo considerable fluctuations from year to year ; and, in conformity with mathematical theory, the fluctuation in the proportions is greatest where the births are fewest in number. Thus in Rutland to 100 girls, 115·4 boys were born in 1850, and 94·8 boys in 1851, the year immediately following. It will be seen whether, on an average of years, there is any great permanent difference in the proportion of boys born in the counties. In all England the proportion of boys has increased since 1850 from 104·2 to 105·1.

The relative ages of the father and mother have probably some influence on the sexes of the children ; but the English schedule does not state the ages of the parents at the birth of the children.

TABLE IX.—BIRTHS registered in each Quarter of the Years 1838 to 1853.

1851	2·276	2·124	103	107
1852	2·320	2·156	103	108
1853	2·379	2·201	104	103
Average of 16 years, { 1838–53	2·319	2·157	103	108

The Table may be read thus :—In the year 1838 to every 100 males living there were 2·335 deaths of males ; to every 100 females living there were 2·133 deaths of females ; and to every 100 females who died there were 105 deaths of males. The last column shows the *relative* mortality of *males and females* ; and that out of *equal numbers living* the deaths of males were 109 to every 100 deaths of females in 1838.

39,763 children were born out of wedlock; or 6·5 in every 100 children born alive. This proportion is less than the proportion (6·8) of the three previous years.

Norfolk (10·6), Hereford (9·8), Salop (9·8), Nottingham (8·5), the North Riding of Yorkshire (8·7), Cumberland (11·7), and Westmorland (8·9), still show a great excess of illegitimate children; while in

Note.—In deducing the results given in this Table a correction has been made for increase of population, based on the numbers enumerated in 1841 and 1851, on the assumption that the increase was uniform in each year (1841—1851). Since the Census of 1851, as no satisfactory data exist for ascertaining the progress of the population, which has been much interfered with by emigration and other causes, the increase has been taken to be approximately represented by the excess of births over deaths registered in each respective year ending June 30th.

Huntingdon (5·0), Devon (5·5), Cornwall (5·0), Warwick (5·4), Durham (5·8), and Monmouth (5·0), the proportions are much lower.

It was shown in my fourteenth Report that to 100 married women of the age 20–40, about 31 children were born in 1851; and that to 100 single women in the same year, 3 children were born. As a general rule the counties in which the unmarried women have proportionally the least number of children, are the counties in which the women write in more than the average proportion of cases. To this rule, however, Westmorland and Cumberland are remarkable exceptions.

The excess of boys among children born out of wedlock was 4·6 in 100; for to 100 girls 104·6 boys were born.

The number of births in the first half exceeded the number in the last half of the year. The births in the four quarters were in the proportions of 1056, 1037, 964, and 943, if 1000 be taken as the quarterly average. (Tables VII., VIII., IX.)

DEATHS.

421,097 persons died in the year.

The mortality was at the rate of 22·88 in 1000 living; which is slightly above the average, 22·38, of the 16 years 1838–53, or nearly 1 in 44 died, instead of 1 in 45.

The Table may be read thus:—Of 100 Males living of the age of 35 and under 45, 1·225 died in 1844, 1·202 in 1845, and so on for other years, a correction for increase of Population having been made for each Age in each Year; and the deaths of persons whose ages were not returned have been distributed proportionally over each age. The data upon which this Table is constructed appear in this or have appeared in the previous Reports, and in the Census Report. See Census Report 1851; and the Annual Reports of the Reg. Gen., particularly the 8th and 9th.

The mortality of males was 23·79, of females 22·01 per 1000 in the year; the average mortality of males, 23·19, being on an average 1·62 in 1000 more than the mortality of females, 21·57.

The deaths of females were in the year to the deaths of males as 100 to 104; while the rates of mortality were as 100 to 108. This difference is caused by the excess of females living in England over the number of males living. The latter numbers show that where 100 females die in England, out of a given number of females living, 108 males would die out of an equal number of males. (Tables X., XI.)

The Table (XII.) shows the mortality of males and of females at twelve periods of life, in the ten years 1844-53. It will be observed, that the greater excess of mortality occurs in boys in the first five years of age, when out of 1000 living 72·75 die annually, while out of the same number of girls only 62·50 die; in the next stage of life (age 5-10) out of the same numbers 9·12 boys, and 8·93 girls die. A change takes place, at the age 10-15, for then 5·16 boys and 5·40 girls die. The mortality of both sexes then increases, and the women up to the age of 35 die in rather greater proportions than men. After the age of 45 the mortality of men is considerably higher than the mortality of women.

In comparing the mortality of 1853, with the average at different ages it will be observed that the excess is most notable in childhood and old age.

The deaths fluctuated in the four quarters of the year from 118,119 in the winter quarter, to 92,201 in the summer quarter; or, putting 1000 deaths

TABLE XIII.—DEATHS registered in each Quarter of the Years 1838 to 1853.

1853	105274	1000	1122	1022	876	930

as the quarterly average, 1122 occurred in the winter, 876 in the summer, quarter. (Tables XIII., XIV.)

Various influences that affect the births, deaths, and marriages are discussed in the Quarterly Reports, extracts from which have been re-printed, and will be found in the Appendix (pp. 1-64).

The causes of death are discussed by Dr. Farr, in a letter addressed to me, which will also be found in the Appendix (p. 65).

The series of Tables that follow this Report (pp. 1-139), are the regular abstracts of some of the principal facts that appear invariably in my reports.

The second series of Tables comprises one of the occasional abstracts and summaries of facts which I am only able to publish at intervals.

MORTALITY OF THE 628 DISTRICTS OF ENGLAND.

In the *Thirteenth Report* the number of people living in 1841 and in 1851, with the number of births and deaths in each of the ten years 1841-1850, were printed, so as to show the natural and the enumerated increase of population in each district of England and Wales. From that extensive series of Returns a new set of Tables has been formed, showing the mortality and the density of the population of each district.

The natural term of human life appears to be *a hundred years*; and out of the annual generations successively born in England and Wales a few solitary individuals attain that limiting age, the rest dropping off year by year as age advances; so that the mean lifetime is at present only 41 years.

If every person born lived 100 years, and the annual births were equal year after year, the mortality would be at the annual rate of 1 in 100, or of 10 in 1000; and if every person lived 41 years, it is obvious that, the births being equal, the mortality would be at the rate of 1 death annually in 41 living, or rather more than 24 deaths in 1000 living.

If the births constantly exceed the deaths in number, upon this hypothesis, the mortality remaining the same, although the mean duration of life remains 41 years, the mean mortality will be below 1 in 41—below 24 in 1000. And the same proportion is true, though the lifetimes of individuals vary from 0 to 100 years: thus though the mean lifetime is 41, the births exceeding the deaths and increasing, the mortality in England and Wales is 1 in 45, or rather more than 22 annual deaths in 1000 living.

Upon referring to Table (XII.) it will be observed that the rate of mortality among children and among men and women of different ages, varies; so that the mortality (73 in 1000) of children under 5 years of age is at nearly three times the average rate of the whole population, while among boys and girls of the age (10-15), the mortality is at the rate of 5 in 1000, or only one fourth or one fifth of the general rate; and the mortality remains below the average until the age of 55, but becomes after that age much above the average. The population in which the annual number of births increases, contains an undue proportion of children, of youths, and of persons of middle age; and the result is, that the rate of mortality is *less* than it would be if the population was in the proportions that would arise from an equal number of annual births.

The deaths to 1000 living in different districts will, therefore, vary to some extent, according as the population is constituted of more or less of the children or adults at the ages that experience a relatively high or a low rate of mortality.

But allowing for the circumstance that the annual deaths to 1000 living in England should be less than they would be if the births did not increase, the mortality of different districts varies with the different degrees of health in the population.

The series of results in the tables (pp. 142-149) was deduced by dividing the deaths in the ten years 1841-50, by *ten* times the arithmetical mean of the population enumerated within the several districts in 1841 and 1851. In some districts the resulting mortality by this method is slightly understated, in others slightly overstated. But the general results, deduced from such an extended series of returns, present a sufficiently correct view of the sanitary state of the various parts of England and Wales.

Upon examining the tables it was found that in three districts (*Rothbury* and *Glendale* in Northumberland, *Eastbourne* in Sussex,) the annual mortality was at the rate of 15 deaths in 1000 living.

The annual rate of mortality was 16 in 1000 living in the fourteen following districts ; Holsworthy (Devon), Battle, Cuckfield (Sussex), Reigate (Surrey), Halthwhistle, Easthampstead, Guisborough, Bootle, Christchurch, Hambledon, Okehampton, Garstang, BUILTH, and Steyning.

The annual mortality was at the rate of 17 in 1000 in Hendon (comprising Harrow), Belford, Southwell, Dorking ; and in all forty-seven districts.

Upon going over these districts it will be found that the health and the circumstances of the population by no means approach any ideal standard of perfection. Nature, however, does much for the inhabitants. The fresh air dilutes the emanations from their nuisances ; and infectious diseases are not easily transmitted from person to person in detached houses. Still the health of the people in those districts admits of improvement ; and it may be assumed with certainty, that the mortality of the English people, in very variable but generally favourable conditions, does *not* exceed 17 in 1000 deaths.

The deaths of 17 persons in 1000 may therefore be considered, in our present imperfect state, natural deaths ; and all the deaths above that number may be referred to artificial causes.

Thus it was shown in my last Report that licensed victuallers, butchers, miners, bakers, shoemakers, tailors, labourers, experience a much higher rate of mortality than farmers. The unhealthy occupations of the people, therefore, contribute to raise the annual mortality above the rate of 17 in 1000.

Where the women are employed in any but domestic labour, they discharge the duties of mothers imperfectly, and the mortality of their children is high. The children in the mining districts, in the straw-plait and lace districts, and in the factory districts, suffer evidently from the want of wise, assiduous maternal care.

The marshes in low, ill-drained districts raise the mortality above 17 in 1000. Thus in Ely, Whittlesey, Wisbeach, and North Witchford, four thinly-peopled, marshy districts of Cambridgeshire round the Wash, the mortality was at the rate of 23, 25, 25, and 27 in 1000. The districts on the lower portions of the Thames suffer from marsh diseases. All our dockyards, except Pembroke, are on unhealthy sites.

One of the greatest and most prevailing causes of ill-health, and of the deaths in excess of 17 in 1000, is the condensation of people in towns, without the requisite mechanical and chemical arrangements for removing concentrated impurities, for supplying pure water, and for introducing through large streets free currents of pure air. To be beyond the reach of these causes this population must be distributed on higher grounds, over wider spaces, on which the sun can shine and the breezes of heaven blow ; proper sanitary arrangements must be made ; and energetic means be adopted to obviate by art all the artificial disadvantages of life in cities. As serious efforts are to be made to obtain the solution of this problem, on which the well-being, happiness, and vigour of many generations of the English race depend, I have deemed it right to publish at once a rough general view of the sanitary state of the country. The future returns will enable us to describe its changes, and I hope to see ultimately brought to bear on it all the exactest methods of statistical inquiry.

It will greatly facilitate sanitary inquiry if a convenient scale can be framed for measuring the degrees of damage, and the loss of life, which each district sustains from the various causes of insalubrity. The most accurate scale is supplied by the Life Table ; which can only be constructed by expending a considerable amount of labour on the returns of each district. A much simpler scale is derived from the rates of mortality. Thus the mortality in the districts of England ranged from 15, 16, and 17 to 36 in 1000.

If, as has been proposed, 17 is taken as the point above which all the mortality is excessive, 17 will be the zero of this new scale ; and in England the scale will range up to 19 or 20 degrees. There are 87 districts experiencing *one* death in excess of 17 annually ; 96 have *two* deaths, and 111 have *three* deaths ; and 18 have *eleven* or *more* deaths in excess annually. These results can be traced in the annexed table (XV.) And it will be observed that the mortality increases as the density of the population, or the nearness of the people to each other, increases in each of the fourteen classes of cases except one.

I have, to facilitate the comprehension and adoption of international measures, shown the number of *hectares* as well as the number of *acres* to each person in England, and in the several counties (pp. 142-143). One column shows the annual rate of mortality in each county ; another the excess in the number of deaths to 1000 living ; and the last column the *excess* in the *number of deaths* over those that *would have happened in the counties if the mortality had been 17 in 1000*. The continuation of the table shows the mortality and the excess of deaths in each district.

It is a remarkable fact that in England, the least unhealthy country in the world, the excess of deaths over those that would have happened if the standard of 17 had obtained universally, was 846,044 in *ten* years ; so that the excess in that time was at the rate of 84,604 deaths in England annually. This excess occurred in 560 districts, for in 64 districts the mortality was below or did not exceed this standard. The people of each district can read their own sufferings and losses in the table ; and I trust that they will succeed in future years in diminishing the fatal numbers.

TABLE XV.—DISTRICTS of ENGLAND grouped in the Order of their MORTALITY.

Number of Districts.	Acres.	Mean Population 1841-1851.	Density and Proximity of Population.			Mortality.	Excess in the Number of Deaths over those that would have happened if the Mortality had been 17 in 1000 living.	
			Acres to a Person.	Persons to a Square Mile.	Proximity or nearness of Person to Person.		Annually to 1000 living.	In the 10 Years, 1841-50.

624	37,324,915	16,903,169	2.21	290	111	22	5	*

NOTE.—In this Table the districts of England are thrown into groups according to their respective rates of mortality. Thus, there were 3 districts in which the annual mortality was 15 in 1000 living, and 111 districts in which the mortality was 20 in 1000 ; this latter group comprises an area of 7,391,920 acres, and a population of 2,336,246, being 3.16 acres to each person or 202 persons to each square mile ; if the population was spread equally over this area their *proximity* to each other would be 133 yards. The annual excess of mortality over 17 in 1000 living is 3, representing an excess of 70,087 deaths in the 10 years 1841-50 among the population living in this group of 111 districts.

* The total of this column gives a higher number (889,089) than the result obtained for the whole of England by a *single operation*, which gives an aggregate of 846,044 deaths, and this latter total, for similar reasons, differs from the aggregate of the results obtained separately for each county, or from the aggregate of the districts.

FAMILY NOMENCLATURE IN ENGLAND AND WALES.

In former reports* I have described the nature and important use of the indexes prepared in this department, by means of which the entry of any registered birth, death, or marriage can be generally referred to, on the mere mention of the name, in a very short space of time. These indexes, which are separately prepared for the births, deaths, and marriages registered in each quarter, receive a yearly addition of upwards of 1,350,000 names; and at the end of the year 1854 they contained the names of 4,828,464 persons married, of 9,598,276 children born, and of 6,622,108 persons who died during the period of $17\frac{1}{2}$ years from 1st July 1837, when the system of general registration commenced. More than 21,000,000 of the names of the immediate subjects of one or more of the important events of birth, death, and marriage were thus inscribed in the indexes to the registers, which thus form a nominal list of no inconsiderable number of the people of England, living or deceased.

The personal or family nomenclature of the inhabitants of any country is a subject of considerable interest. Much that is illustrative of their early condition, customs, and employments is often discoverable in the names which have been handed down to them from bygone generations, and an investigation of the origin and character of these names will always afford matter for curious speculation and useful inquiry. English surnames have already to some extent engaged the attention of antiquaries and others, who have brought to light many interesting facts on the subject; but several curious questions as to the number and extension of particular surnames have never, owing doubtless to the want of a sufficient collection of observations, been fully examined. As a contribution in aid of such inquiries, it may prove not uninteresting to notice here a few of the more obvious facts derived from the indexes to the registers, leaving the application of them to those whose tastes may lead them to follow up the subject.

The most striking circumstance presented by the indexes is the extraordinary number and variety of the surnames of the *English* people. Derived from almost every imaginable object,—from the names of places, from trades and employments, from personal peculiarities, from the Christian name of the father, from objects in the animal and vegetable kingdoms, from things animate and inanimate,—their varied character is as remarkable as their singularity is often striking. Some of the terms which swell the list are so odd and even ridiculous that it is difficult to assign any satisfactory reason for their assumption in the first instance as family names, unless indeed, as has been conjectured, they were nicknames or *sobriquets*, which neither the first bearers nor their posterity could avoid.

In Wales, however, the surnames, if *surnames* they can be called, do not present the same variety, most of them having been formed in a simple manner from the Christian or fore-name of the father in the genitive case, *son* being understood. Thus, Evan's son became **Evans**, John's son **Jones**, &c. Others were derived from the father's name coalesced with a form of the word *ap* or *hab* (son of), by which Hugh ap Howell became **Powell**, Evan ap Hugh became **Pugh**, and in like manner were formed nearly all the Welsh surnames beginning with the letters B and P. Hereditary surnames were not in use even amongst the gentry of Wales until the time of Henry VIII., nor were they generally established until a much later period; indeed, at the present day they can scarcely be said to be adopted amongst the lower classes in the wilder districts, where, as the marriage registers show, the Christian name of the

* First and Sixth Annual Reports of the Registrar General.

father still frequently becomes the patronymic of the son in the manner just described.*

The probable number of surnames in England and Wales has been the subject of conjectural estimates based on a small collection of facts. By the careful collation of all the registration indexes it could be approximately ascertained; for during a period of more than seventeen years it is probable that almost every resident family contributed to the registers an entry of birth, death, or marriage. The task of collating upwards of two hundred immense quarterly indexes would, however, involve a vast amount of labour without any commensurate result; moreover the number of names is constantly varying, owing, on the one hand, to emigration, or to the extinction of families by death, and on the other, to the introduction of fresh names by foreigners and immigrants, to the corruption of existing names always going on amongst the illiterate, and to various other circumstances. I have ascertained the number of different surnames contained in one quarterly index of births, and in another of deaths; the former selected with reference to the period of the last census, and the latter without premeditation. The following are the results:—

		Persons registered.	Different surnames.
BIRTHS.	Quarter ending 31st March 1851	- 157,286	25,028
DEATHS.	Quarter ending 31st March 1853	- 118,119	20,991

According to these numbers, there were for every 100 of the births registered about 16 different surnames, and for every 100 of the deaths about 18, reckoning every surname with a distinctive spelling, however slightly it may differ from others, as a separate surname. Taking the two indexes together, and by a careful collation eliminating all duplicates, the numbers stand thus:—

Persons registered.	Different surnames.	Different surnames to every 100 persons.	Persons to one surname.
275,405	32,818	11·9	8·4

An alphabetical list of 32,818 surnames, the largest collection yet made, is thus obtained; and as this result is furnished by two quarterly indexes only, it may be assumed as a rough estimate that the whole number in England and Wales is between *thirty-five* and *forty thousand*. It is important, however, to remember that the list includes a large number derived from the same roots as others, commonly agreeing in sound, but differing in orthography often only to the extent of a single added or substituted letter. By these trifling variations the number is immensely increased. The name of **Clerk**, for instance, is also commonly spelt **Clark** and **Clarke**, one and the same primary name (from *clericus*) being implied in the three forms; but three separate items necessarily appear in the list, for practically as *surnames* they represent different and distinct persons and families. Again, the widely spread name of **Smith** appears in family nomenclature also as **Smyth**, **Smythe**, and even as **Smijth**. It is not usual, however, to regard these diverse forms as representing one name only, nor would their bearers probably all concur in admitting the common origin of the several variations. Until a comparatively recent period, an entire disregard of uniformity and precision in the mode of spelling family names prevailed, even amongst the educated classes, and many family Bibles and writings might be adduced as evidence that this was apparently less the result of carelessness than of affectation or design. While the *sound* was in a great measure preserved, the number of different

* So late as the time of the accession of the House of Hanover, the unabbreviated prefix "ap" was very commonly used, and, by employing it with the contracted form, three generations could be expressed in one name; thus *Richard ap Pritchard* implied Richard the son of Pritchard the son of Richard.

surnames became greatly multiplied by these slight orthographical variations, as well as by other corruptions; and if, in reckoning the number, each original patronymic with its modifications were counted as one, the list of 32,818 would be considerably reduced.

The contribution of Wales to the number of surnames, as may be inferred from what has been already stated, is very small in proportion to its population. Perhaps nine tenths of our countrymen in the principality could be mustered under less than 100 different surnames*; and while in England there is no redundancy of surnames, there is obviously a paucity of distinctive appellatives in Wales, where the frequency of such names as **Jones, Williams, Davies, Evans**, and others, almost defeats the primary object of a name, which is to distinguish an individual from the mass. It is only by adding his occupation, place of abode, or some other special designation, that a particular person can be identified when spoken of, and confusion avoided in the ordinary affairs of life. The name of **John Jones** is a perpetual incognito in Wales, and being proclaimed at the cross of a market town would indicate no one in particular. A partial remedy for this state of things would perhaps be found in the adoption of a more extended range of Christian names, if the Welsh people could be induced to overcome their unwillingness to depart from ancient customs, so far as to forego the use of the scriptural and other common names usually given to their children at baptism.

From the circumstance of their common British origin it might be supposed that the Welsh people and the inhabitants of Cornwall would exhibit some analogous principles in the construction of their surnames; such, however, is not the case. The Cornish surnames are mostly local, derived from words of *British* root, and they are often strikingly peculiar. A large number have the prefix *Tre*, a town; the words *Pol*, a pool, *Pen*, a head, *Ros*, a heath, and *Lan*, a church, are also of frequent occurrence in surnames. The Cornish family nomenclature differs so materially from that of the rest of England, that I have thought it not uninteresting to give a few specimens of it (see page xxviii).

The local distribution of surnames is not the least interesting branch of this subject; for most persons will have remarked that every district of the country possesses some surnames rarely met with anywhere else, the origin of which must be sought for in circumstances peculiar to the locality. To trace out the connection between the surnames and these circumstances is a task which may be most advantageously undertaken by local inquirers; and the indexes prepared by each superintendent registrar, and preserved with the registers in his custody, would prove useful adjuncts in such investigations.

While it is obvious that the original adoption of a particular surname was the result in most cases of arbitrary circumstances,—since **John Smith**, instead of being called after his occupation, might equally have chanced to become **John Johnson** from his father's Christian name, or **John Wood** from the situation of his abode, or **John Brown** from his complexion,—it is curious to remark the predominance of certain names, which seem to have been adopted preferentially by large numbers of the people, or conferred upon them by others, and now prevail in every county of England. Do these common names hold the same rank in point of numbers which they had at first, or have some of them spread and multiplied more rapidly than others? For instance, is the present predominance of the **Smiths** amongst English surnames due to the original

* Of the 328 Registration Officers and their deputies acting in the Districts of Wales, 207 are comprised under 17 surnames, in the following proportions; viz., Jones 46, Williams 26, Davies 16, Evans 16, Thomas 15, Roberts 14, Lewis 11, Hughes 10, Edwards 8, Lloyd 8, James 6, Griffith 6, Morgan 6, Rees 6, Owen 5, Morris 4, and Ellis 4. There is only one officer of the name of Smith. The Districts referred to are numbered 581 to 623 in the Abstracts, and include some portions of English Counties on the Welsh border.

numerical strength of that great family, or to some special circumstances acting upon the ordinary laws of increase, owing to which the descendants of the hammer-men have multiplied at a greater rate than the bearers of any other name ? Has the progeny of the tawny **Browns** increased faster than that of the fair-complexioned **Whites**, relatively to the original numbers of each race, so as to account for the excess of the former over the latter ; or were the **Browns** in a majority in the first instance ? Various are the surmises and speculations to which such questions may give rise. One point, however, the registration indexes enable us to determine ; the particular names which have ultimately attained the strongest hold on the people ; and also, with tolerable certainty, the relative numbers of the adherents of each.

The subjoined list (Table XVI.), of 50 of the most common surnames in England and Wales is derived from 9 quarterly indexes of births, 8 of deaths, and 8 of marriages ; and although the inquiry might have been extended over a more lengthened period, it was found that the results were in general so constant as to render a further investigation unnecessary. When arranged according to the numbers in each index, the names appeared almost always in the same order, and the variations, when they occurred, rarely affected the position of a name beyond one or two places. These 50 names embraced nearly 18 in every 100 of the persons registered. The 3 names at the head of the list, **Smith, Jones,** and **Williams**, are, it will be observed, greatly in advance of the others ; and if the numbers may be taken as an index of the whole population, it would appear that on an average one person in every 28 would answer to one or other of these 3 names.

Regarded with reference to their origin (See Table XVII.), it seems that of the 50 most common names more than half are derived from the Christian or fore-name of the father, and are thus literally *sire-names* or *sirnames*. This is the most primitive form of a second name, and it was extensively used amongst the Anglo-Saxons as well as by other European

TABLE XVI.—FIFTY of the most common Surnames in England and Wales, with the aggregate Number of each entered in the Indexes of Births, Deaths, and Marriages in the Year ending 30th June 1838; of Births in the Quarter ending 31st March 1851, and of Births, Deaths, and Marriages in the Year 1853.

nations.* Names derived from occupations are next in number, and contribute 13 to the list. After the **Smiths** come the **Taylors**, who are about half as numerous as the **Smiths**; next the **Wrights**, amounting to about half the number of the **Taylors**; then the **Walkers**, **Turners**, **Clarks**, **Coopers**, **Wards**, **Bakers**, and **Clarkes**. The **Clarks** and the **Clarkes**, if taken collectively, would occupy the third place in the list of names derived from employments; a fact which points significantly to the importance attached to the clerical office, and to the possession of a moderate amount of learning, in rude and unlettered times, when a king received his characteristic epithet (**Beau-clere**) from his scholarship. This class of surnames is peculiarly instructive as illustrating the pursuits and customs of our forefathers; many of them furnish evidence of a state of society impressed with the characteristics of feudal times; and not a few are derived from terms connected with the amusements of the chase and other field sports to which our ancestors were so ardently attached. Widely different would be a national nomenclature derived from the leading occupations of the present day. The thousands employed in connexion with the great textile manufactures would take precedence even of the **Smiths**; while the **Taylors** would give place to the shoemakers (now scarcely recognizable under the not common surname of **Suter** with its variations **Soutter**, **Sowter**, &c.†), as well as to the **Colliers**, the

(a) Most of the families of this name are of Welsh extraction, *Mawrrwyce* being the Welsh form of *Mavors* (Mars), the god of war, whose name was often bestowed upon the warlike. Others of this name are supposed to be of Moorish origin.

(b) From the German *walker*, a fuller; or, as some have supposed, the appellation of an officer whose duty consisted in "walking" or inspecting a certain extent of forest ground.

* What are called Christian names were in England in times anterior to the Norman conquest usually the sole names borne by individuals.

The names used by the Anglo-Saxons were remarkably beautiful and expressive. The following are examples:—*Alfred*, all-peace; *Edmund*, a speaker of truth; *Godwin*, beloved of God; *Leofwin*, win-love; *Ranulph*, fair-help; *Raymund*, quiet, peace; *Alwin*, winning all or all-beloved. The Saxon termination *ING*, signifying offspring, is said to have been gradually rejected for *SON* in the tenth and eleventh centuries. See *Lower on English Surnames, Essay 2*.

† In the eleventh and twelfth centuries, the period at which surnames became hereditary in England, the common people of the better sort, as well as the upper classes, wore shoes or short boots, usually with "chaussés"—drawers with long stockings or pantaloons with feet to them. (*Planché's History of British Costume*, c. vi.) It is somewhat singular, therefore, that while the occupation of the tailor has given name to so numerous a family, that of the maker of shoes and boots exercised so little influence in bestowing a permanent designation upon its followers and their posterity.

Carpenters, the Farmers, and others. The Hawkers, Falconers, Bowyers, Fletchers, Arrowsmiths, Palmers, Pilgrims, Friars or Freres, and a host of other family names derived from various callings which have become obsolete in this country, would be wanting.* Seven of the 50 surnames belong to the class of local surnames, and are expressive of situation, as Wood, Hall, Green, &c.; and two (Brown and White) are derived from personal peculiarities.

The surname of Smith is pre-eminently the most common in England, as that of Jones is in Wales; and so great is the multitude of the Welsh Joneses, that the latter name not only enters into competition for priority in point of numbers with the Smiths, but in several years shows a majority over its rival. With a view to determine the relative frequency of these two widely-spread surnames, I have ascertained the numbers of each entered in the indexes during the years 1838-54. The result is that the births, deaths, and marriages of the Smiths registered in this period were 286,037, and those of the Joneses 282,900, the excess in favour of the former being 3137 in the 17 years. Smith is, therefore, unquestionably the most common surname amongst us, although the Joneses are little less numerous, and in six of the years actually contributed to the registers larger numbers than the Smiths. Together the bearers of these two common names amounted to 568,937, or 1 in 36 of the whole number registered, during the period referred to. (See Table XVIII).

Assuming that the persons of the surnames of Smith and Jones are born, marry, and die in the same proportions as persons of all surnames, it will follow that in England and Wales there are not less than half a million of persons bearing one or other of those two surnames. The Smiths amount to rather more than a quarter of a million, and the

(TABLE XVIII.)—NUMBER of PERSONS of the respective Surnames of Smith and Jones contained in the Registration Indexes of Births, Deaths, and Marriages in each of the Years 1838-54.

YEARS.	Number of the Surname of SMITH.	Number of the Surname of JONES.	Difference.

* The following are the OCCUPATIONS in which the largest number of Males were employed at the Census of 1851 :—

Agricultural labourer, Farm servant, Shepherd	1,110,311	Butcher	60,569
Labourer (Branch undefined)	324,594	Grocer	58,228
Farmer, Grazier	226,515	Painter, Plumber, and Glazier	56,536
Shoe and Boot maker	211,000	Inn-keeper, Licensed Victualler, Beer-shopkeeper	55,707
Cotton, Calico manufacture, Printer, Dyer	191,071	Worsted manufacture	51,495
Coal-miner	183,389	Baker	45,605
Army and Navy (of United Kingdom)	178,773	Carman, Carter, Carrier, Drayman	43,710
Carpenter and Joiner	156,111	Silk manufacture	43,598
Mason, Pavior, Bricklayer	144,785	Engine and Machine maker	42,454
Domestic Servant (as Footman, Coachman, &c.)	124,595	Commercial Clerk	37,529
Tailor	115,471	Draper	34,015
Blacksmith	94,214	Hose, Stocking manufacture	33,599
Messenger, Porter, Errand-boy	88,950	Boat and Barge-man	32,617
Woollen Cloth manufacture	76,837	Miller	31,998
Seaman (Merchant Service) on shore or in port	74,911	Sawyer	30,531
Gardener	69,685	Cabinet-maker, Upholsterer	30,385
Iron manufacture	66,080		

Joneses to little less ; together forming no inconsiderable portion of the English population. These numbers represent, on the assumption that the average number of persons in a family is the same as in the whole population at the census, viz: 4·8 persons, about 53,000 families of **Smiths**, and 51,000 families of **Joneses**; and to give an illustration of their numerical power, it may be stated that these two great tribes are probably sufficiently numerous to people the four towns of Birmingham, Bristol, Leeds, and Hull, without any addition of persons of other surnames.

Upon the facts derived from the indexes of the registers for the year 1853, the probable number of persons in England and Wales bearing each of the 50 most frequent surnames has been computed. The results will be found in the subjoined Table (XIX.) From this estimate it appears that the persons by whom these 50 surnames are borne amount to about 3,253,800 ; nearly one sixth of the entire population of England and Wales. On an average, it seems, one person in 73 is a **Smith**, one in 76 a **Jones**, one in 115 a **Williams**, one in 148 a **Taylor**, one in 162 a **Davies**, and one in 174 a **Brown**.

TABLE XIX.—ESTIMATED NUMBER OF PERSONS IN ENGLAND AND WALES bearing the under-mentioned Fifty most common SURNAMES. (Deduced from the Indexes of the Registers of Births, Deaths, and Marriages, and the estimated Population in the Year 1853.)

Thus, if divided into *four* groups it would be convenient to take the letters A to D, E to J, K to R, S to Z; for *three* groups A to F, G to O, P to Z; for *two* groups, A to J, K to Z, &c.

It is sometimes useful, in dealing with an extensive list of names, to know the proportionate numbers commencing with each letter of the alphabet. With such information, the names may be subdivided, according to the initial letters, in groups, large or small, so as to secure tolerably equal numbers in each group. The experience of the department in this respect, derived from the registration indexes, is given in Table XX. It appears that the letter B is the most frequent initial of surnames amongst us, comprising more than a tenth of the whole. Next in number are the surnames ranked under the letter H (9·5 per cent.); then those under S. and W. (8·9 and 8·7 per cent.) The vowels, which enter largely into the words of the English language from their occurrence in the prefixes *ab, ac, ex, in, im, un, &c.*, are not extensively used as the initial letters of surnames; and amongst the consonants N and K are the first letters of the fewest surnames, except X and Z. As many words in common use, chiefly of Anglo-Saxon origin, have been adopted as surnames, the philologist may probably trace some relation between the surnames and the words of the language beginning with the same letters; but so large have been the additions made to the English vocabulary in modern times, that such a connexion is by no means obvious in reference to the words now found in our dictionaries.

Such are a few of the principal results presented by the registration indexes. A more extended examination of these large collections of surnames would doubtless develope other facts of equal interest. It is to be hoped that the authorities of some of the continental states, possessing similar sources of information, will be induced to make public such facts as may without much trouble be obtained. Being furnished with the means of comparison, we shall be able to ascertain what affinities exist between our own surnames and those of other nations, and perhaps to discover new relations between different members of the great European family.

As a matter of curiosity rather than of practical use, I have appended a list of some of the more singular names which have been met with in the two quarterly indexes already referred to. This selection might have been much enlarged; but it will suffice to show how very peculiar are some of the terms which have acquired a fixed position in our family nomenclature.

A Report, embodying the proposed plan of an amended Statistical Nosology, drawn up by Dr. Farr for the consideration of the International Statistical Congress which met at Paris in September 1855, is printed in the Appendix (p. 71). The suggested nomenclature of diseases was adopted by the Congress; but with respect to the proposed mode of classifying them no decision was then taken. I have deemed it unadvisable, therefore, to alter the form of classification which has been in use for some years in this Department until Dr. Farr's labours and proposal, now brought before the public, have been further considered.

Dr. Farr's attendance at the Statistical Congress was authorized by the Government, and he was requested to report upon its proceedings; his Report will also be found in the Appendix (p. 106).

I have the honour to be,

Sir,

Your faithful Servant,

GEORGE GRAHAM,

Registrar-General.

A LIST of PECULIAR SURNAMES in England and Wales, selected from the Indexes of Births registered in the Quarter ending 31st March 1851, and of Deaths registered in the corresponding Quarter of 1853.

* The Districts are collections of contiguous Parishes or Places, combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts are arranged according to their local position under the Registration Counties.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle adopted has been to place a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

MARRIAGES, BIRTHS, and DEATHS registered in the Year 1853.

* The Districts are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages; and are generally identical with the Poor Law Unions of the same names. The Districts, 625 in number, are arranged according to their local position under the Registration Counties.

† For a table of the Deaths in the principal Public Institutions situated in the Districts of London see page 85.

Note. Wherever the minus sign is prefixed to the number in the column headed "Excess of Births over Deaths," it denotes that the Births in the District, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

NOTE.—The Sub-districts are sub-divisions of the Districts, and comprise the Parishes or Places in which the Births and Deaths are registered by Registrars severally appointed for that purpose.

The letter W denotes that the Sub-district contains within its limits a Workhouse belonging to the District or Union; w indicates that a Workhouse belonging to another District or Union is included.

Wherever the minus sign (–) is prefixed to the numbers given in the Column headed “Excess of Births over Deaths,” it denotes that the Births in the Sub-district, instead of exceeding the Deaths, were, in fact, less than the Deaths to the extent stated.

The Excess of Deaths over Births in several of the Sub-districts of London is attributable to the mortality in Hospitals.

For the number of Deaths in the Hospitals, Workhouses, and other principal Public Institutions in London, see page 85.

* By the formation of the new District of Whitechurch in April 1853 several townships were detached from Sub-district 611; 2. In consequence of this change the name of the Sub-district has been altered from Malpas to Holt.

† In February 1853 the limits of all the Sub-districts (Amlwch excepted) of the Anglesey District were more or less altered on the formation of the Holyhead Poor Law Union, which consists of Sub-districts 623; 2, 5, and 6.

LONDON.—Number of DEATHS in the different Classes of PUBLIC INSTITUTIONS during the Year 1853.

INSTITUTIONS.		DEATHS in 1853.	Of the Total Deaths in London the Proportion per Cent. in Public Institutions.

Note.—The Population used in obtaining the results given in this Table is the arithmetical mean of the numbers enumerated in 1841 and 1851.

* The Density of Population in each Division and County according to French Measure is here inserted for the convenience of Persons who may be more accustomed to the “Hectare” than to the “Acre” as a measure of surface; and it may be here stated that a French Hectare is equivalent to 2·471143 (nearly 2½) English Acres, or, expressed in other terms, an English Acre represents ·404671 (rather more than 4-10ths) of a French Hectare.

DENSITY of POPULATION, ANNUAL MORTALITY, and EXCESS of DEATHS over 17 in 1000 Persons living, in the COUNTIES and DISTRICTS of ENGLAND, 1841-50 — *continued.*

NOTE.—In calculating the mortality of the London districts, an approximate correction has been made for hospitals, by taking the number of deaths and inmates in 1851 as the basis, and assuming that the mortality was uniform during the 10 years 1841-50; the numbers were then deducted from the deaths and population of the districts in which each hospital is situated, and distributed proportionally over every district of London.

* H against the name of a district indicates the existence of one or more hospitals of some magnitude; h denotes a smaller hospital.

† This correction for the Medway district has been obtained by taking the average deaths in Fort Pitt and Fort Clarence during three years (1841, 1845, and 1850), as indicating approximately the average annual mortality during the 10 years 1841-50; the aggregate number of deaths thus obtained, together with the arithmetical mean of population enumerated in the same institutions in 1841 and 1851, were then subtracted from the deaths and population of the entire district. The same principle was applied in correcting the mortality of Alverstone (No. 97), Uxbridge (No. 133), and East Stonehouse (No. 288.)

! Contains the Royal Sea-bathing Infirmary.

In calculating the mortality of the London Districts an approxi-
mate correction has been made for Hospitals by taking the number
of Deaths and Inmates in 1851 as the basis, and assuming that the
mortality was uniform during the 10 years 1841-50. The numbers
were then deducted from the Deaths and Population of the Dis-
tricts in which each Hospital is situated, and distributed propor-
tionately over every District of London.

AREA, POPULATION 1841 and 1851, and NUMBER of DEATHS in the Ten Years 1841-50; with
in TOWN DISTRICTS and

TOWNS. Represented approximatively by the following DISTRICTS and SUB- DISTRICTS.	Area in Statute Acres.	Population enumerated.		Deaths in the 10 Years, 1841-50.	Limits included.
		1841.	1851.

EXTRACTS

FROM THE

QUARTERLY RETURNS

OF

MARRIAGES, BIRTHS, AND DEATHS

Issued in the Year 1853.

NOTE.—*The numbers of Births and Deaths published in these Returns were furnished by the Registrars at the end of each Quarter, when they could not be subjected to revision at the General Register Office; they will be found therefore to differ in some instances from the more correct numbers now given in the preceding Abstracts.*

1853.]

QUARTERLY RETURN

[No. 1.

OF

THE MARRIAGES, BIRTHS, AND DEATHS
IN ENGLAND.

THIS Return comprises the BIRTHS and DEATHS registered by 2190 Registrars in all the districts of England during the Winter quarter ending March 31st, 1853; and the MARRIAGES in more than 12000 churches or chapels, about 3373 registered places of worship unconnected with the Established Church, and 624 Superintendent Registrars' offices, in the quarter that ended December 31st, 1852.

The Return of Marriages is not complete; but the defects are inconsiderable, and approximative numbers have been supplied from the records of previous years.

The marriages in the last quarter, and in the whole of the year 1852, have greatly exceeded in number those of any previous return; and this increase of families, confirming other accounts, implies that the condition of the great body of the people is prosperous. But the prosperity of a nation is sometimes overpowered by death, and it has happened that the mortality at the close of the year 1852, as well as in the winter of the present year, has, notwithstanding the activity of trade, been unusually high, through the inclemency of the season, the prevalence of epidemics, and perhaps the partial destruction of the potato crop.

MARRIAGES, BIRTHS, and DEATHS, returned in the Years 1841-53 and in the Quarters of those Years.

* The numbers up to 1850 have appeared in the Annual Reports.

MARRIAGES.

94416 persons were married in the last quarter of the year 1852, the three months after harvest, the Christmas quarter, in which, according to the customs of England, the greatest number of weddings are celebrated. This number, however, exceeds the numbers in the corresponding quarter of any previous year; and if the whole year is taken, it shows a proportional excess. There were 158439 marriages in the year 1852, 153740 in 1851, and, only ten years ago, 118825 in the year 1842. The marriages in the five years 1838-42 were 605219, in the five years 1848-52 they were 745030. The marriages in England from 1843 to 1852 were at such a rate that 1 in 60 people married annually; the proportion in 1852 was 1 in 57; while in the last quarter of the year 1852 it was 1 in 48. The increase is greatest in London, where 7101 marriages took place in the last quarter of 1852. The increase in the other divisions is less remarkable; and in the South Midland, as well as the Eastern Counties, the rate of marriages was below the average.

BIRTHS.

161598 births were registered in the quarter ending March 31st, 1853. The number is slightly less than the number registered in the corresponding quarter of the year 1852, but in excess of the number registered in the winters of any previous years. The greatest number of births is registered generally in the spring, but in 1852 it happened exceptionally that the births in the winter exceeded the births in the spring quarter. The annual proportion of births since 1843 has been 1 in 30; in the winter quarter the average rate is 1 in 29; in the winter quarter of the present year it has been 1 in 28.

INCREASE OF POPULATION.

As the births registered in the winter quarter were 161598, and the deaths 118241, the natural increase of which we have an account is 43357. The natural

† The Table may be read thus, without reference to the decimal points:—In the year 1848, to 100000 of the population of England there were 798 marriages, 3249 births, 2307 deaths registered.—The annual rates of marriage in each of the 4 quarters were ·661, ·805, ·755, and ·961 per cent.; the rates of death 2·794, 2·313, 2·005, and 2·108 per cent. In reading the population on the first line add 3 ciphers (000). The 3 months January, February, March, contain 90, in leap year 91 days; the 3 months April, May, June, 91 days; each of the 2 last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

increase of population, owing to the high rate of mortality, is less than usual, and less by 12000 than it was in the winter quarter of 1852. The tide of emigration still rolls on, and in the winter 57729 persons left the ports of the United Kingdom at which there are Government Emigration Agents.* 43493 emigrants sailed from Liverpool, 7249 from London, and 2129 from Plymouth; but it must be borne in mind that a large number of the emigrants from Liverpool are Irish, who resort to that port for the convenience of embarkation.

The price of provisions has still further advanced; wheat, which in the winter quarter of 1852 was 40s. 10d., is in the present season 45s. 7d.; beef, by the carcase, at Leadenhall and Newgate markets has risen from 4½d. to 4½d. a pound; mutton, from 4¾d. to 5¾d. a pound; and potatoes (York regents), which were 70s. in the winter of 1852, are 127s. 6d. a ton in the winter of 1853; a price which, it is to be feared, places this esculent beyond the reach of many poor families. It may be here stated, that the potato cannot be replaced by bread, beans, or pease alone, and that in its absence an extra allowance of fruit, green vegetables, or herbs is required. Scurvy, in consequence of the neglect of this precaution, prevailed extensively in the spring of the year 1847, after the first great destruction of the potato crop.

The AVERAGE PRICES of Consols, of Wheat, Meat, and Potatoes; also the AVERAGE QUANTITY of Wheat sold and imported weekly, in each of the Seven Quarters ending March 31st, 1853.

† Note.—The total number of quarters of wheat sold in England and Wales for the 13 weeks ending Sept. 30th, 1851, was 971,276; for the 13 weeks ending Dec. 31st, 1,423,582; for the 13 weeks ending March 31st, 1852, 1,241,921; for the 13 weeks ending June 30th, 1,143,339; for the 13 weeks ending Sept. 30th, 1,023,251; for the 13 weeks ending Dec. 31st, 1,445,906; for the 13 weeks ending March 31st, 1853, 1,236,493. The total number of quarters entered for Home Consumption was respectively 1,183,523; 671,803; 358,024; 710,780; 882,850; 947,310; and 825,886; the second total, however, embraces the returns of 14 weeks.

STATE OF THE PUBLIC HEALTH.

118241 deaths have been registered in the first three months of the present year, a number exceeding by 11559 the deaths in the winter quarter of 1852, and by

* Return with which the Registrar General has been favoured by the Emigration Commissioners.

still more the deaths in any previous winter, except the winters of 1847 and 1848, when influenza and cholera prevailed. The annual mortality in England has, within the last 10 years, been at the rate of 2·252 per cent. ; on an average of the 10 winter quarters the rate has been 2·467 per cent. ; in the winter of the present year 2·620 per cent. The annual rate of mortality was raised in both the town and the country ; in 117 districts, comprising the chief towns, from 2·759 to 2·888 per cent. ; in 507 country and small town districts, from 2·246 to 2·397 per cent. The ratio is increased by the season more in the country than it is in the towns ; which, however, still maintained their fatal pre-eminence, destroying by their dirt and imperfect sanatory arrangements, out of the same population, 5 lives to every 4 who die in the open country.

Small-pox, scarlatina, typhus, influenza, or bronchitis have prevailed in many places, and are the proximate causes of the excessive mortality.

The excess of mortality has been general, but it has been greatest in the South-western Division (V.), in the Division (VI.) on the Severn, in Wales, and in Lancashire : on the whole, the western side of the island appears to have sustained the heaviest losses.

LONDON has latterly been unusually unhealthy, but the excess of deaths is chiefly referable to the depression of the temperature in February and March ; and in the 13 weeks the deaths, allowing for increase of population, have not exceeded the numbers in the winter quarters of 1849 and 1851. Of the zymotic class of diseases, scarlatina (574), whooping-cough (702), and typhus (662), were the most fatal. Consumption has been unusually fatal, and the deaths were 1872 to 1630 in the winter quarter of 1849. Bronchitis was fatal to a greater number of persons (1880) than consumption, or to 600 more than died of that disease in the winter quarters of 1849, 1850. Carbuncle has been unusually fatal ; the deaths in the last five winter quarters have been 1, 2, 3, 17, 20. There is no decline in the deaths from delirium tremens, or intemperance, or poison. The deaths by fractures and contusions exhibited a remarkable increase ; they have been in the five last winter quarters 114, 139, 163, 161, and 181.

In the SOUTH EASTERN DIVISION (II.) the most remarkable feature is the high mortality in Croydon. The deaths in this district from all causes in the winter quarter were 275 ; while in the four previous winter quarters they were 194, 155, 139, and 144. The Registrar in his note simply states, that fever caused the increase of deaths, and that it has now happily subsided. No further notice is

here necessary, as the disease has been the subject of investigation by able sanatory inquirers appointed by Her Majesty's Government. Fever has also prevailed at Brenchley in the Tunbridge District, and at Fawley in the New Forest.

In the SOUTH MIDLAND DIVISION, Hatfield, Chesham, Wendover, Waddesdon, Leckhampstead, Henley, Towcester, Bedford, Wisbeach, and Ely, have experienced a higher mortality than the average, chiefly from fever or bronchitis; at the present time there are several bad cases of fever in Daventry. Romsey, in Huntingdon, has suffered from intermittent and other fevers, from erysipelas, and from boils. The registrar of Luton, the seat of the straw-plait works, says, the population has increased by 2000 persons since 1851.

In the EASTERN DIVISION influenza has prevailed in a part of the Maldon district; mumps in Coggeshall; typhus in Dunmow; fever in parishes of Stow; small-pox in several districts of Norfolk. In Rougham typhus has prevailed; it is in a low damp district, and "the dwellings are little better than pigsties or hovels."

In the SOUTH WESTERN DIVISION a fever nearly as fatal as the Croydon fever broke out at *Longbridge Deverill* (Warminster), where the deaths in three months, without including those in other parts of the sub-district, were 27. The ravages of the fever, it is said, were confined to the space of 100 yards square. Small-pox has prevailed in Exeter and the surrounding districts, where, by the cruel negligence and ignorance of their parents, the lives of many children are sacrificed. The increased mining operations and the increase of population in Cornwall are referred to by the registrars. Cornwall as well as Somersetshire has suffered from scarlatina and small-pox.

The deaths in the WEST MIDLAND DIVISION (VI.) were 14832, a number considerably exceeding the average. Small-pox was fatal to many children in Bristol. Typhus was fatal in Albrighton, in Shropshire, and in Wem, where the disease was in one case communicated to the family by a child returning from service after an attack of fever, which resulted in the death of the father and 2 children.

The Registrar of St. Mary, Shrewsbury, where the deaths exceeded the births registered, states, that there has been much sickness during the quarter, partly from damp and floods and partly from the want of better sanatory regulations. "The nuisance (he says) in this district by the dye-waste water running from the thread manufactory into the Shrewsbury Canal, a stagnant water, causing an offensive and abominable stench, is very injurious to the health of a dense and complaining population. It is, however, gratifying to add, that the authorities are taking up this and other nuisances in order to their removal."

Fever and scarlatina and bronchitis have been fatal in several districts of Staffordshire, Worcestershire, and Warwickshire. The Registrar of Holy Trinity, Coventry, has the following remarks on the inefficiency of the medical attendance on the poor: "Although out of the 106 deaths 78 are entered as 'certified,' there is reason to believe that comparatively very few of these received any systematic medical treatment, but that the certificates were obtained from professional men whose attention had been called to the cases almost at the last moment, when death appeared to be inevitable. During this quarter I have registered the births of 11 illegitimate children, and 10 deaths of the same class."

In the NORTH MIDLAND DIVISION (VII.) the mortality has been considerably above the average in Ashby, Lincoln, Spilsby, Basford, Nottingham, Southwell, Belper, and Bakewell, and chiefly from scarlatina, fever, and small-pox. Fever has been very prevalent in several villages round Lincoln, and in Lincoln would, probably, have been more fatal had it not been for the improved condition of the labouring classes and the effective drainage of the country.

In the NORTH-WESTERN DIVISION (VIII.) the mortality of Liverpool was high, but not so high as in previous years; the mortality of Manchester was above its average, so was that of Bolton, Blackburn, and Preston.

The Registrar of St. George, Liverpool, says: "There has been a continued current of emigration flowing through the town from various parts to distant shores, but the numbers of births and deaths have not been much affected thereby."

The Registrar of Hulme, Chorlton, near Manchester, adverting to the rapid growth of the population, says: "Former years, however, bear little comparison with the last, during which many new entire streets have been formed, acres covered, and almost every vacant space built upon; still the houses are occupied almost before finished or fit for habitation. This indicates a very prosperous condition of the working classes, by whom these tenements are chiefly occupied."

In the YORK DIVISION (IX.) the mortality was above the average in Sheffield, Selby, Howden, Sculcoates, York; scarlatina, small-pox, and fever have been prevalent diseases. "Sheffield," the registrar of the south sub-district says, "is full of strangers, and they are temporarily at least more healthy than the indigenous inhabitants. The immigrants come from Lincoln, Notts, Northampton, Norfolk, principally, with some from the East Riding of York. Certainly there has been a great improvement in diet within the last few years." The Common Lodging House Act is said to operate beneficially in Sheffield (West).

The health of the NORTHERN DIVISION (X.) was somewhat below the average. The mortality in Hexham, Morpeth, Glendale, Penrith, and Cockermouth exceeded the average of those districts. The cold weather has been severely felt; scarlatina, small-pox, and fever have prevailed. In Southwick and Monkwearmouth offensive nuisances abound.

WALES has experienced a high rate of mortality; the deaths in the last winter quarter (7,853) exceeded the deaths (6,737) in the winter quarter of 1852 by 1,116. Small-pox, scarlatina, measles, hooping-cough, and fever have prevailed; and the cold weather has been fatal. Typhus in Hope, Wrexham, is ascribed to the neglect of sanatory measures.

The Registrars of several districts call attention to the neglect of vaccination, and to the consequent mortality from small-pox, although many instances such as the following occur, everywhere confirming the confidence of the medical profession in the protection which is furnished by efficient vaccination:—"In several families," says the Registrar of Basford, Nottingham, "where the children are numerous, one unvaccinated, a child, has taken small-pox and died; the other children, all of whom had been vaccinated, entirely escaped the disease. This I have clearly ascertained by repeated visits since the occurrence of the deaths in these families."

The outbreaks of cholera in Russia demand the attention of the people of England; and should accelerate all the arrangements for the supply of pure water, the drainage of towns, and the removal of nuisances.

The disturbed meteorology of the quarter, the high temperature of January, the low temperature of February and March, the extreme transitions of heat and cold, the unusual falls of snow, the hail, the fogs, the thunderstorms, the lightning, the zodiacal lights, auroras, solar halos, and lunar halos in England, the South of Scotland, and parts of Ireland, are described by Mr. Glaisher (page 11) from continuous observations made at fifty stations by the enterprise of private observers (chiefly) under his assiduous superintendence. It is difficult to overrate the value which these observations possess and will acquire, as the diseases of men, the crops of the agriculturists, as well as the health of their herds, and many manufacturing processes, depend on the state of the weather to an extent which has not yet been determined.

* In the present publication the "Registration Counties" comprise groups of entire Registration Districts, or Poor Law Unions; and when a District runs into two or more Counties, it has been placed with the County in which the greater part of the Population is situated: hence these groups of Districts rarely, if ever, correspond with the strict boundaries of the respective Counties named.

NOTE.—The first 13 weeks of 1853, constituting the March quarter in the Weekly Tables of Mortality, ended March 26th, in which 15864 deaths were registered. In the quarter ending March 31st (p. 7), 16013 deaths were registered.

* Under the head of *sudden deaths* are classed not only deaths described as sudden, of which the cause has not been ascertained or stated; but also all deaths returned by the coroner in vague terms, such as “found dead,” “natural causes,” &c. &c.

On the Meteorology of England, the South of Scotland, and parts of Ireland, during the Quarter ending March 31st, 1853. By JAMES GLAISHER, ESQ., F.R.S., Sec. of the British Meteorological Society.

The very high temperature of the last two months of the preceding year continued till the end of January; the daily temperature during this month was frequently 8° and 9° in excess, and not seldom amounted to 12° , 13° , or 14° . The mean temperature of the month was $42^{\circ}\cdot 4$, exceeding the average of 80 years by $6^{\circ}\cdot 7$. The mean temperature of the 3 months ending January was $46^{\circ}\cdot 3$, being of higher value than that of any corresponding 3 months on record. The nearest approach to this value was in 1806 and 1807, when the mean temperature of the same three months was $43^{\circ}\cdot 6$. On February 1st a period of weather of the opposite character suddenly set in, the daily temperature being in defect on every day till March 4th occasionally to the amount of 10° or 12° ; during this interval of time the temperature was occasionally very low, the weather was exceedingly severe, and snow more or less fell on every day. The average defect of daily temperature for the period was $5^{\circ}\cdot 4$. From March 5th to March 14th the weather was mild, the average excess of daily temperature was $4^{\circ}\cdot 2$. On March 15th the weather again set in with severity, snow fell on every day till the 27th to a considerable depth in some places, and the defect of daily temperature to the end of the quarter amounted to $6^{\circ}\cdot 5$.

The quarter has been remarkable for the extremes of heat and cold for the season, and for an unusual number of days on which snow has fallen in the months of February and March.

The mean temperature of the air at Greenwich for the quarter ending February, constituting the 3 winter months, was $41^{\circ}\cdot 1$, being $3^{\circ}\cdot 5$ above the average of 80 years.

NOTE.—In reading this table it will be borne in mind that the sign (—) minus signifies below the average, and that the sign (+) plus signifies above the average.

Thunderstorms occurred, or thunder was heard and lightning seen, on the 2d, 5th, and 8th January at Whitehaven; on the 11th at Hartwell House and Linslade; on the 15th at Guernsey; and on the 21st at Jersey and Guernsey. On the 15th, 16th, and 17th February at North Shields; and on the 23d at Nottingham. On the 13th March at Nottingham; on the 15th at Wakefield and York; on the 22d at North Shields; and on the 27th at Holkham.

Thunder was heard, but lightning was not seen, on the 21st January at Grantham. On the 16th February at Newcastle; and on the 13th March at Grantham.

Lightning was seen, but thunder was not heard, on the 4th January at North Shields; on the 7th at Cardington; on the 11th at Clifton, Bicester, Oxford, Stone, Hartwell Rectory, Cardington, and Durham; on the 13th at Bicester; and on the 15th at Jersey, Ryde, and Bicester. On the 28th February at Stone and Hartwell Rectory. On the 4th March at Durham; on the 13th at Jersey; and on the 30th at Stone and Hartwell Rectory.

Hail fell on the 5th January at Ennis and Liverpool; on the 6th at Lewisham, Oxford, Stone, Hartwell Rectory, Bedford, and Ennis; on the 11th at Stone, Hartwell Rectory, Ennis, and Stonyhurst; on the 15th at Guernsey and Falmouth; on the 17th at North Shields; on the 21st at Guernsey, Falmouth, Truro, Aylesbury, Ennis, Hawarden, and Stonyhurst; on the 22d at Falmouth, Hartwell House, Hartwell Rectory, Ennis, Grantham, and Hawarden; on the 23d and 25th at North Shields; and on the 26th at Falmouth and Stone. On the 4th February at Guernsey, Aylesbury,

and North Shields; on the 5th at Guernsey; on the 7th at Dunino; on the 8th at Ennis and North Shields; on the 9th and 10th at North Shields; on the 11th at Jersey, Cardington, Holkham, and North Shields; on the 13th at Guernsey; on the 17th at Falmouth; on the 20th at Hartwell Rectory; on the 22d at Hawarden; on the 23d at Ryde, Grantham, Hawarden, and Dunino; on the 25th at Hartwell Rectory; on the 26th at Jersey, Falmouth, Truro, Liverpool, Manchester, and North Shields; on the 27th at Jersey, Falmouth, and Truro; and on the 28th at Jersey and Stonyhurst. On the 1st March at Jersey, Hartwell Rectory, and Wakefield; on the 2d at Hartwell Rectory and Hawarden; on the 13th at Nottingham; on the 14th at Falmouth; on the 15th at Falmouth, Ennis, and Hawarden; on the 16th at Nottingham; on the 17th at Ennis; on the 18th at Hartwell Rectory; on the 19th at Jersey; on the 20th at Hawarden and Gainsborough; on the 21st at Jersey, Falmouth, Truro, Hawarden, and North Shields; on the 22d at Falmouth, Lewisham, Bedford, Hawarden, and North Shields; on the 23d at Lewisham, Greenwich, Ennis, and North Shields; on the 24th at Lewisham, Hartwell Rectory, and Ennis; and on the 25th at Hartwell Rectory.

Fog was prevalent on 1st January at North Shields; on the 10th at Grantham; on the 14th at Lewisham, Grantham, and Stonyhurst; on the 16th at Midhurst, Norwich, and Grantham; on the 18th at Lewisham; on the 19th at Clifton, Linslade, and Stonyhurst; on the 21st at Southampton and Lewisham; on the 24th at Paddington and Grantham; on the 25th at Paddington; on the 26th at Paddington, Grantham, and Manchester; on the 27th at Grantham; on the 28th at Ennis and Grantham; on the 30th at Paddington; and on the 31st at Clifton, Lewisham, Paddington, Linslade, and Leeds. On 1st February at Midhurst, Clifton, Lewisham, Paddington, St. John's Wood, Bicester, Stone, Hartwell House, Hartwell Rectory, Linslade, Grantham, Wakefield, Leeds, and Stonyhurst; on the 2d at Midhurst, Lewisham, Paddington, St. John's Wood, and Stonyhurst; on the 4th and 5th at Manchester; on the 6th at Southampton, Paddington, Grantham, and Wakefield; on the 8th at Clifton, Ennis, Wakefield, and Leeds; on the 11th at Royston; on the 13th at Manchester; on the 15th at Lewisham; on the 19th at Stone and Grantham; on the 22d at Manchester; and on the 28th at Greenwich. On 5th March at Stone, Grantham, Manchester, and Wakefield; on the 6th at Bicester, Norwich, and North Shields; on the 7th and 8th at Midhurst, Clifton, and Norwich; on the 9th at Ryde, Midhurst, Clifton, Lewisham, Greenwich, Paddington, St. John's Wood, Bicester, Linslade, and Wakefield; on the 11th at Paddington, St. John's Wood, Linslade, and Wakefield; on the 12th at Clifton, Lewisham, Greenwich, St. John's Wood, Grantham, and Wakefield; on the 13th at Lewisham, Wakefield, and North Shields; on the 15th at Clifton and Stone; on the 16th at Clifton, Bicester, Stone, and Hartwell House; on the 21st at Paddington; on the 24th at Midhurst, Clifton, and Greenwich; on the 25th at Manchester; on the 26th at Hartwell Rectory; on the 28th at Clifton; on the 29th at Manchester and Wakefield; on the 30th at Midhurst and Wakefield; and on the 31st at Wakefield.

Zodiacal Light was seen on 30th January at Durham, and on the 31st at Nottingham and Durham. On 7th February at Durham, and on the 27th at Nottingham. On 8th March at Rose Hill and Nottingham; on the 10th at Hartwell House and Durham; on the 11th at Rose Hill; on the 27th at Durham; on the 28th at Grantham; on the 29th at Stone, Hartwell House, Grantham, Nottingham, and Durham; and on the 30th at Grantham.

Aurora were seen on 4th January at Hawarden; on the 5th at Stone and Hawarden; on the 7th at Clifton, Rose Hill, Oxford, Stonyhurst, and Dunino; on the 8th at Stonyhurst; on the 15th at Clifton; and on the 31st at Grantham and Durham. On 14th February at Whitehaven; on the 15th at Nottingham; on the 16th and 17th at North Shields; on the 23d at Nottingham; on the 26th at Guernsey; on the 27th at Nottingham, Hawarden, Stonyhurst, and Whitehaven; and on the 28th at Stone and Hartwell Rectory. On 7th March at Midhurst, Clifton, Hawarden, and Durham; on the 8th at Clifton, Stonyhurst, and Durham; on the 10th and 11th at Dunino; on the 17th at Bicester, Stone, and Hartwell Rectory; on the 21st at Holkham; and on the 29th at Stone.

Solar Halos were seen on 13th January at Greenwich; on the 16th at Nottingham, Stonyhurst, and North Shields; on the 17th at Nottingham and North Shields; and on the 20th at Hartwell Rectory. On 7th February at Stonyhurst; on the 10th at Hawarden and Stonyhurst; on the 12th and 13th at Nottingham; on the 15th at Royston and Liverpool; on the 16th and 17th at Nottingham; on the 18th at North Shields; on the 26th at Nottingham; on the 27th at Grantham; and on the 28th at Stonyhurst and Dunino. On 4th March at Hawarden; on the 9th at Stone, Hartwell Rectory, and Aylesbury; on the 11th at Stone and Hartwell Rectory; on the 14th at Whitehaven; on the 20th at Dunino; on the 22d at Hartwell House; on the 23d at Stone, Hartwell Rectory, and Nottingham; on the 26th and 30th at Dunino; and on the 31st at Midhurst, Stone, Hartwell Rectory, and Nottingham.

Lunar Halos were seen on 3d January at Hawarden; on the 14th at Grantham; on the 15th at Ryde, Stone, and Hartwell Rectory; on the 16th at Whitehaven and Durham; on the 18th at Midhurst, Bicester, Oxford, Stone, Hartwell Rectory, Cardington, and Grantham; on the 20th at Midhurst, Lewisham, Greenwich, St. John's Wood, Oxford, Stone, Hartwell House, Cardington, Grantham, Nottingham, Hawarden, Liverpool, and Dunino; on the 21st at Nottingham; on the 22d at Wakefield; on the 25th at Hartwell House; and on the 29th at Durham. On 14th February at Nottingham; on the 15th at Liverpool; on the 18th at Durham; on the 19th at Royston; on the 21st at Nottingham, Stonyhurst, and Durham; on the 22d at Nottingham, Hawarden, Liverpool, North Shields, and Dunino; on the 23d at Liverpool; and on the 25th at Midhurst. On 14th March at Stone and Hartwell Rectory; on the 16th at Warrington; on the 19th at Stone, Hartwell Rectory, Liverpool, Manchester, Whitehaven, and Durham; on the 20th at Clifton, Hawarden, Warrington, Liverpool, Manchester, Stonyhurst, Durham, and North Shields; on the 21st at Oxford and Cardington; on the 22d at Stone, Hartwell House, Hartwell Rectory, Nottingham, and Hawarden; on the 23d at Stone, Hartwell Rectory, and Cardington; and on the 24th at Midhurst and Liverpool.

NAMES OF THE PLACES.	Mean Pressure of dry Air reduced to the level of the Sea.	Mean Temperature of the Air.	Highest Reading of the Thermometer.	Lowest Reading of the Thermometer.	Mean Daily Range of Temperature.	Mean Monthly Range of Temperature.	Range of Temperature in the Quarter.	Mean Temperature of Evaporation.	Mean Temperature of the Dew Point.	Mean estimated Strength.	General Direction.	WIND.	Mean Amount of Cloud.	RAIN.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.	Height of Cistern of the Barometer above the level of the Sea.
														Number of Days on which it fell.	Amount collected.

The mean of the numbers in the first column is 29.578 inches, and it represents that portion of the reading of the barometer due to the pressure of air; the remaining portion, or that due to the pressure of water, is 0.209 inch; the sum of these two numbers is 29.787 inches, and it represents the mean reading of the barometer for the quarter at the level of the sea.

The highest readings of the thermometer in air were 63° 5 at Lewisham, and 62° 0 at Truro and Manchester.

The lowest readings were 7° 2 at Holkham, 11° 0 at Rose Hill, and 12° 0 at York. The least daily ranges of temperature took place at North Shields, Guernsey, Liverpool, and Durham; and the greatest at Aylesbury, Southampton, Oxford, and Ryde.

Rain fell on the least number of days at Midhurst, Ryde, Chiswell Street, Southampton, Liverpool, and Stonyhurst; and on the greatest number at Royston and North Shields. The least falls took place at Liverpool, Chiswell Street, Cardington, Bedford, Derby, Clifton, Leeds, Rose Hill, and Greenwich; and the mean amount at these places is 4.1 inches. The largest falls occurred at North Shields, Guernsey, Whitehaven, and Falmouth, and their mean is 9.8 inches.

QUARTERLY METEOROLOGICAL TABLE for different PARALLELS of LATITUDE.

PARALLELS OF LATITUDE, &c.	WIND.								RAIN.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.	Mean Height above the Sea level.	
	Mean Temperature of the Air.	Mean of Highest Readings of the Thermometer.	Mean of Lowest Readings of the Thermometer.	Average Daily Range of Temperature.	Average Monthly Range of Temperature.	Average Quarterly Range of Temperature.	Mean Temperature of Evaporation.	Mean Temperature of the Dew Point.	Mean Amount of Cloud.	Average Number of Days.							Average fall.

In the formation of this Table the results from Jersey and Guernsey have not been combined, on account of the difference between the ranges of temperature of the two places. The results from Ventnor are not combined, on account of the much higher temperature, and less range of temperature than those at the other stations in the Isle of Wight. The results from Chiswell Street have also not been combined.

MONTHLY METEOROLOGICAL TABLE FOR THE QUARTER ENDING MARCH 31st, 1853.

The Observations have been reduced to Mean values, and the Hygrometrical results have been deduced — from Glaisher's Tables.

Year 1853.	Months.	NAMES of STATIONS and OBSERVERS.	Mean Pressure of		Temperature of the Air.						Mean Tem- perature of		Wind.	Rain.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean Degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.							
			Air and Water, or Mean Read- ing of the Bar- ometer.	Water or Elastic Force of Vapour.	Range of Barometer Readings in the Month.	Mean.		Highest.	Lowest.	Range in the Month.	Mean of all the Highest.	Mean of all the Lowest.		Mean Daily Range.	Evaporation.						Dew Point.	Estimated Strength.	Direction.	Mean Amount, of Cloud.	Number of Days it fell.	Amount col- lected.	
						From Dry Thermometer.	From Self- registering Therm.																				Adopted.

Newport :—The reading of the maximum thermometer on January 3d has been altered from 58° 50' to 48° 50'. Ryde :—The reading of the barometer on March 29th, at 9h. A.M., has been altered, conjecturally, from 29° 887 in. to 30° 087 in. Southampton :—All the barometer readings are too low. Midhurst :—The reading of the barometer on March 12th, at 9h. A.M., has been altered, conjecturally, from 30° 310 in. to 30° 110 in.

[illegible]

Bedford :—The mean reading of the wet-bulb thermometer uncorrected, in March, has been altered, conjecturally, from $35^{\circ} \cdot 8$ to $37^{\circ} \cdot 8$.
Norwich :—The mean temperature of January was $40^{\circ} \cdot 4$ above ; February, $50^{\circ} \cdot 5$ below ; and March, $40^{\circ} \cdot 6$ below the average of 12 years.

Year 1853.	Months.	Names of Stations and Observers.	Mean Pressure of		Temperature of the Air.						Mean Temperature of		Wind.	Mean Amount of Cloud.	Rain.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional weight required to saturate a cubic foot of Air.	Mean Degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.
			Air and Water.	Water or Elastic Vapour.	Range of Barometer in the Month.	From Dry Bulb Thermometer.	From Self-registering Thermometer.	Mean.	Adopted.	Highest.	Lowest.	Range in the Month.			Mean of all the Days.	Highest.

Alderley Edge.—The observations in January were taken on 22 days only. The reading of the barometer on 12th March, at 7h. 30m. A.M., has been altered, conjecturally, from 29.690 to 29.490. Bowdon.—March. Several readings of all the elements evidently erroneous. Leeds.—January. The barometer reading on the 23d, at 3 p.m., altered from 30.532 to 30.132, and the reading of the wet-bulb thermometer on the 24th, at 3h. P.M., altered from 30.512 to 30.012. March; several readings of all the elements evidently erroneous. Stonyhurst.—The reading of the barometer on 14th March, at 9h. A.M., has been altered from 29.770 to 29.670. York.—The mean reading of the wet-bulb thermometer in February was given as 60.3 higher than the dry-bulb. The mean temperature of January was 35.6 above; and March, 40.9 below the average of 20 years.

NOTE.—Second rain gauges are placed: At Jersey at the height of 6 feet; the amount collected was 7.6 inches. At Newport, 3 feet; the amount was 6.9 inches. At Clifton, 50 feet; the amount was 3.4 inches. At Midhurst, 21 feet; the amount was 3.5 inches. At Oxford, 22 feet; the amount was 3.5 inches. At Hartwell Rectory, 4 feet; the amount was 4.6 inches. At Cardington, 36 feet; the amount was 2.8 inches. At Norwich, 31 feet; the amount was 5.9 inches. At Ilkham, 4 feet; the amount was 5.9 inches. At Nottingham, 25 feet; the amount was 4.6 inches.

1853.]

QUARTERLY RETURN

[No. 2.

OF

THE MARRIAGES, BIRTHS, AND DEATHS
IN ENGLAND.

THIS Return comprises the BIRTHS and DEATHS registered by 2190 Registrars in all the districts of England during the spring quarter ending June 30th, 1853; and the MARRIAGES in 12025 churches or chapels, about 3396 registered places of worship unconnected with the Established Church, and 625 Superintendent Registrars' offices, in the quarter that ended March 31st, 1853.

The Return of Marriages is not complete; but the defects are inconsiderable, and approximative numbers have been supplied from the records of previous years.

The increase of marriages proceeded at an accelerated rate through the first three months of the year; in April, May, and June the births of children exceeded the average numbers of preceding spring quarters, but fell a few hundreds short of the births in the spring quarters of the two previous years.

The spring in town and country was unhealthy; and the mortality, chiefly owing to the cold weather and the scarcity of potatoes, was considerably above the average.

MARRIAGES, BIRTHS, and DEATHS, returned in the Years 1841-53 and in the Quarters of those Years.

* The numbers up to 1850 have appeared in the Annual Reports.

MARRIAGES.

35014 marriages were celebrated in the first quarter of the year, or 2081 more than were celebrated in the corresponding quarter of 1852. The unexampled increase of marriages is shown in the annexed Table, where it will be observed that in the winter quarters 48894 persons married in 1841, 54960 in 1847, 70028 in 1853.

The increase in the marriages is most conspicuous in London, in the seaports, and in the manufacturing towns; in Northamptonshire, Devonshire, Cornwall, Gloucestershire, Shropshire, Staffordshire, Worcestershire, Leicestershire, Nottinghamshire, Cheshire, Lancashire, the West Riding of Yorkshire, Westmorland, and Monmouthshire; in Portsmouth, Plymouth, Southampton, Bristol; in Northampton, Bath, Stroud, Wolverhampton, Dudley, Birmingham, Nottingham, Chester, Manchester, Leeds, Sheffield, Merthyr Tydfil. In all the most prosperous districts of the country the marriages increased. In Dover, in Brighton, in St. George Hanover Square, in several other districts, and in the eastern counties the marriages declined.

BIRTHS.

The births fluctuate less than either the marriages or the deaths, and in the three quarters ending June 1851-52-53 the numbers were 159138, 159136, and 158718, or nearly the same in amount, but considerably above the average of preceding years. The births, on an average of 10 spring quarters, were at the rate of 3.428 per cent.; in the last quarter ending June 30th the rate was 3.507 on the population.

INCREASE OF POPULATION.

As the births of 158,718 children and the deaths of 107,861 persons of all ages were registered in the quarter, a balance of 50857 remains in favour of the population.

† The Table may be read thus, without reference to the decimal points:—In the year 1848, to 100000 of the population of England there were 798 marriages, 3249 births, 2307 deaths registered.—The annual rates of marriage in each of the 4 quarters were .661, .805, .755, and .961 per cent.; the rates of death 2.794, 2.313, 2.005, and 2.108 per cent. In reading the population on the first line add 3 ciphers (000). The 3 months January, February, March, contain 90, in leap year 91 days; the 3 months April, May, June, 91 days; each of the 2 last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

lation. The excess of births over deaths is less by 8 or 12 thousands than the excess in the corresponding quarters of the three previous years; chiefly owing to the high rate of mortality in 1853. 115,959 emigrants sailed from the ports of the United Kingdom at which there are Government Emigration Agents; 78205 to the United States, 20107 to British North America, 17152 to the Australian Colonies, and 495 to other places. 7884 of the emigrants sailed from Glasgow and Greenock, 16993 from Irish ports, 74646, including many Irish, from Liverpool, 2095 from Plymouth, 3722 from Southampton, and 10619 from London.* The emigration from the United Kingdom has been at the rate of 8920 a week, equal to the number of inhabitants in a majority of the 368 municipal boroughs of Great Britain. In Scotland and Ireland the births and deaths of the population are left unregistered, so that it is impossible to determine the rate of natural increase in the United Kingdom; but at the rate prevailing in England, which it cannot exceed, the excess of births over deaths would be 79820, or less by 36139 than the 115959 emigrants.

The price of provisions during the quarter was considerably higher than the ruling prices in the corresponding months of the year 1852; wheat was sold on an average at 44s. 6d., a quarter; beef, by the carcase, in London at 4⁷/₈d. per pound;

The AVERAGE PRICES of Consols, of Wheat, Meat, and Potatoes; also the AVERAGE QUANTITY of Wheat sold and imported weekly, in each of the Eight Quarters ending June 30th, 1853.

† Note.—The total number of quarters of wheat sold in England and Wales for the 13 weeks ending Sept. 30th, 1851, was 971,276; for the 13 weeks ending Dec. 31st, 1,423,582; for the 13 weeks ending March 31st, 1852, 1,241,921; for the 13 weeks ending June 30th, 1,143,339; for the 13 weeks ending Sept. 30th, 1,023,251; for the 13 weeks ending Dec. 31st, 1,445,906; for the 13 weeks ending March 31st, 1853, 1,236,493; for the 13 weeks ending June 30th, 1853, 1,099,261. The total number of quarters entered for Home Consumption was respectively 1,183,523; 671,803; 358,024; 710,780; 882,850; 947,310; 825,886; and 1,074,095; the second total, however, embraces the returns of 14 weeks.

* Return with which the Registrar General has been favoured by the Emigration Commissioners.

mutton 5½*d.* per pound ; potatoes (York regents) at 127*s.* 6*d.* per ton. The price of wheat was 10 per cent., beef 22 per cent., mutton 31 per cent., potatoes 31 per cent. higher in April, May, June 1853 than in the corresponding months of 1852. It is evident that the price of wheat bears no longer any constant relation to the price of the other chief articles of food consumed by the rich or the poor ; and it must be considered a fortunate circumstance that the price of bread is not now likely to fluctuate so largely as the prices of the more perishable articles with which the markets of England are supplied from a comparatively limited area.

STATE OF THE PUBLIC HEALTH.

107,861 deaths were registered in the 3 months of April, May, and June. This number is the highest that has ever been registered before in the corresponding season, and exceeds by 7048 the deaths in the spring quarter of 1852. The rate of mortality in England is highest in the winter (2·467 per cent.), lowest in the summer quarter (2·129 per cent.), while the mortality of the spring quarter (2·223) holds an intermediate rank, near the average of the year. This average is exceeded by the present return, which shows a mortality at the rate of 2·383 per cent. per annum ; higher than the rate in the corresponding quarter of every year 1843–52, except the spring quarter of 1847, when the population was infested by scurvy and its attendant diseases after the great failure of the potato crop in 1846. The rate of mortality was then 2·506 ; in the autumn influenza broke out, and cholera followed on its footsteps in 1848 and 1849.

The mortality of the quarter was above the average both in the town and in the country districts ; the annual rate of mortality was 2·606 in 117 districts, comprising the chief towns, and 2·196 per cent. in 508 districts, extending over the rest of the kingdom.

The population of England is, there is reason to believe, collectively healthier than any equal amount of population in any other kingdom ; but the rapid increase in the proportion of the town population,—in which the mortality is 27 per cent. higher than it is in the country, and the sickness, the suffering, the debility, the physical degeneracy of race are in an equal excess,—makes this question of the health of towns and the fertilization of the surrounding fields one of the great questions of the day demanding immediate solution. It is difficult for the imagination to conceive all the beneficent effects that would flow from the possible diminution of

DEATHS in the Spring Quarters.

The YEAR -	258	203	55

* This Table is derived from the returns of the 10 years 1843-52.

In LONDON the mortality has considerably exceeded the average, and it is chiefly due to diseases of the respiratory organs, typhus, hooping-cough, diarrhoea, and violence of various kinds. 12 deaths were referred to privation, 26 to poison, 88 to burns and scalds, 86 to hanging and suffocation, 81 to drowning, 171 to mechanical injuries of various kinds, 33 to wounds; and in nearly all these cases the numbers exceed those returned in previous years. The violent deaths, including a few from intemperance, want of breast-milk, and privation, in London, increased from 1296 in 1840 to 2140 in 1852; and in the last quarter the excess in deaths from violence alone over the deaths of 1852 was 131. The increase of steam vessels, railways, omnibuses, and new mechanical forces of every kind, as well as the obstructions of the streets, may partly account for this loss of life, as well as for the numerous injuries and mutilations not fatal—in the battle of every day.

The mortality in the SOUTH EASTERN Counties has been above the average, and the greatest excess has occurred in Godstone, Croydon, Bromley, Dover, Eastbourne, Lewes, the Isle of Wight, Alverstoke. Woking has been unusually healthy. Scarlatina has been rife in Sevenoaks, Maidstone, and other districts.

In the SOUTH MIDLAND Counties Wisbeach continues to experience a high rate of mortality; the deaths in three months, out of a population of 36215, were 274. In Cambridge, on the other hand, the deaths out of a population of 27815 were only 110. Hooping-cough and bronchitis prevailed at Wisbeach; while in Cambridge the Registrar reports, that “great improvements have been made by the local authorities in the sanitary arrangements; they have been assisted very materially by the reports and suggestions of the medical profession.”

Romford, Tendring, Colchester, Witham, and Saffron Walden in ESSEX; Sudbury, Thingoe, and Stow in SUFFOLK, experienced a high rate of mortality. Typhus has been fatal to many persons in High Easter, Dunmow; in Downham, NORFOLK, ague and fever have prevailed; in Norwich the mortality has not exceeded, and in the whole county has been below the average.

In the SOUTH WESTERN Counties the general mortality has slightly exceeded the average. The typhus in Longbridge Deverill broke out a second time; and the deaths in the sub-district equal the births. In one house the man, wife, and 6 children were all attacked, and one child, nine years of age, died. At Exmouth fever has prevailed. In Whipton, Heavitree, small-pox is raging; several children are suffering, and 2 have died; “still the people refuse cow-pox.” In Barnstaple typhus and small-pox have prevailed; the deaths have exceeded the births. The emigration from Redruth has been extensive, and the births have consequently decreased; in another district of Cornwall, Lerrin, the Registrar says: “The births and deaths are much below the average. Numbers are yearly leaving this district for other parts of this country, or for America and Australia, which is the only explanation I can give of the decrease.”

Measles has been very fatal in Truro. In Frome the deaths from pulmonary diseases are much above the average; the same diseases have prevailed in Bath.

In the WEST MIDLAND COUNTIES the mortality is somewhat above the average; small-pox prevails in Gloucestershire; Bristol, Gloucester, and Stroud have neglected vaccination; carbuncles, boils, and purulent eruptions have been very prevalent in Stow-on-the-Wold as well as in London. This extensive epidemic has not yet obtained all the attention which it deserves from the medical profession. A bad form of scarlatina has prevailed in Staffordshire, "the cause of which," the Registrar of Bilston conceives, "is insufficient drainage, cesspools stagnating, and filth of the most offensive character accumulated in the yards and folds of the poor, who have been the victims of the fever." The excess of births in West Bromwich and Westbury-on-Severn is ascribed to the increase of population caused by employment on railways. The prosperous state of trade and the improved circumstances of the people are also mentioned in connexion with a low rate of mortality.

The deaths in LINCOLNSHIRE have been below, in NOTTINGHAMSHIRE and DERBYSHIRE above the average. The Registrar of Leake in Leicestershire says:—"Several deaths have occurred during the quarter from scarlatina and from small-pox. The latter disease has been very prevalent in a village belonging to my district. The ignorance and wilful stupidity which exist amongst a certain class of people are astonishing; neither threats nor entreaties can induce them to have their children vaccinated. A young woman, near her confinement, and the mother of two other children, who refused to be vaccinated herself or have her children vaccinated, was seized with small-pox. On June 12th I attended her; the disease was confluent; she became a most loathsome object, and in this state gave birth to a girl on the 15th, and died on the 18th. The infant took the disease, and has since died. I have vaccinated a large number of children and a few adults, but the same prejudice still exists with others, and this frightful disease is yet progressing. I am firmly convinced that if every child was properly vaccinated under the age of 12 months there would be no cases of small-pox, or it would be so modified as to require little notice. I am of opinion that the disease would in the end be extirpated."

Cheshire and Lancashire have not been more than usually unhealthy. 2759 deaths were registered out of a population of 411,515 in Liverpool and West Derby; 2365 in Manchester and Salford out of 315,956. The mortality in these districts was below the average to which they are subject. This district, says the Registrar of Hulme, Chorlton, "never was in a more healthy state. No kind of epidemic prevails. The operative classes are all well employed, and although the prices of various kinds of provisions are on the advance, there appears a general disposition to increase wages in proportion."

In YORKSHIRE 11442 deaths were registered. The mortality exceeded the average, and most notably in Skipton, Keighley, Huddersfield, Halifax, Bradford, Sheffield, Rotherham, Doncaster, Thorne, and Driffield. In Leeds and Hull the mortality declined. One death from cholera was registered in the workhouse, Horton, Bradford. Influenza prevailed in Leyburn; scarlatina in Reeth.

In the NORTHERN COUNTIES 5621 deaths were registered. Ague, typhus, and hooping-cough have prevailed in many of the Durham colliery districts; 23 persons died of measles in Yarm, Stockton.

The deaths in the WELSH DIVISION (7288) exceed the average; hooping-cough prevailed in Newport, Swansea, and Haverfordwest; small-pox and bronchitis in Cardiff and Carmarthen. The excess of births and deaths in Rheidol, Aberystwith, is referred to the great increase of the mining population. Small-pox, scarlatina, and typhus still prevail in the Wrexham District. "The Board of Guardians are causing proceedings to be taken against the owners and occupiers of houses, as directed by the Nuisances Removal and Diseases Prevention Act, and in all cases where they have summoned have succeeded in getting convictions."

NOTE.—The 13 weeks of 1853, constituting the June quarter in the Weekly Tables of Mortality, ended June 25th, in which 15030 deaths were registered. In the quarter ending June 30th (p. 23), 14594 deaths were registered.

* Under the head of sudden deaths are classed not only deaths described as sudden, of which the cause has not been ascertained or stated; but also all deaths returned by the coroner in vague terms, such as "found dead," "natural causes," &c. &c.

On the Meteorology of England, the South of Scotland, and parts of Ireland, during the Quarter ending June 30th, 1853. By JAMES GLAISHER, ESQ., F.R.S., Sec. of the British Meteorological Society.

Till April 17th the daily temperature of the air was alternately in excess and defect to the amount of several degrees, and was $1^{\circ}\cdot7$ in excess in the period. On April 20th a period of very cold weather set in, and continued till May 15th; on some days the defect amounted to 8° , 9° , 10° , and on two days to the very large amounts of 13° and 14° ; the average defect for the period was $4^{\circ}\cdot9$. From May 16th to May 27th the weather was fine, and the excess of daily temperature was $4^{\circ}\cdot2$; from May 28th to the end of the quarter, with very few exceptions, the weather was cold and unseasonable, and the average daily defect of temperature was $1^{\circ}\cdot7$. The weather during the whole quarter has been unsettled; rain has fallen frequently, there has been an unusual prevalence of N.E. and N.W. winds, and the temperature has been very variable.

The mean temperature of the air at Greenwich for the quarter ending May, constituting the 3 spring months, was $45^{\circ}\cdot2$, being $1^{\circ}\cdot2$ below the average of 80 years.

NOTE.—In reading this table it will be borne in mind that the sign (—) minus signifies below the average, and that the sign (+) plus signifies above the average.

Thunderstorms occurred, or thunder was heard and lightning seen, on the 3d April at Stone, Hartwell House, Hartwell Rectory, Aylesbury, and Linslade; on the 7th at Newcastle; on the 8th at Greenwich; on the 20th at Midhurst; on the 22d at Clifton; on the 23d at Hartwell House, Aylesbury, and Cardington; on the 24th at Holkham, North Shields, and Dunino; on the 25th at Jersey and Liverpool; on the 27th at Durham; and on the 28th at Newcastle. On the 9th May at Grantham; on the 16th at Midhurst and Clifton; on the 27th at Greenwich and Cardington; on the 28th at Rose Hill, Bicester, Oxford, Stone, Hartwell House, Hartwell Rectory, Aylesbury, Nottingham, and Hawarden; on the 29th at Lewisham and Greenwich; and on the 30th at Torquay, Midhurst, and Clifton. On the 11th June at Lewisham, Greenwich, Bicester, Stone, Hartwell House, Hartwell Rectory, Aylesbury, and Linslade; on the 14th at Lewisham, Bedford, Dunino, and Arbroath; on the 18th at Newcastle; on the 19th at Hawarden, Warrington, Liverpool, and Stonyhurst; on the 20th at Bicester, Stone, Hartwell House, Hartwell Rectory, Aylesbury, Linslade, and Royston; on the 21st at Newport; on the 23d at Manchester, Stonyhurst, and Dunino; on the 24th at Greenwich, Paddington, Bicester, Oxford, Stone, Hartwell House, Hartwell Rectory, Aylesbury, Linslade, Cardington, Bedford, Norwich, Holkham, Nottingham, and Dunino; on the 25th at Nottingham; and on the 30th at Nottingham, Warrington, and Manchester.

Thunder was heard, but lightning was not seen, on the 1st April at St. John's Wood; on the 7th at North Shields; on the 23d at Stone and Nottingham; on the 24th at Nottingham, Stonyhurst, and Dunino; and on the 25th and 27th at Hawarden. On the 8th May at Paddington; on the 9th at Royston and Nottingham; on the 14th at Guernsey; on the 16th at Stonyhurst; on the 17th at Exeter; on the 19th and 26th at Holkham; on the 27th at Stone, Hartwell Rectory, and Royston; on the 28th at Exeter, Linslade, and Cardington; and on the 29th at Norwich, Grantham, and Arbroath. On the 5th June at Wakefield; on the 6th at Grantham and Nottingham; on the

8th at Stonyhurst; on the 9th at Norwich; on the 10th at Stone; on the 11th at Rose Hill, Stone, and Nottingham; on the 12th at Oxford, Cardington, and Nottingham; on the 13th at Nottingham; on the 14th at Lewisham, Greenwich, St. John's Wood, Stone, Hartwell Rectory, Aylesbury, Cardington, Nottingham, Wakefield, North Shields, Dunino, and Arbroath; on the 15th at Stone and Norwich; on the 19th at Cardington, Bedford, Nottingham, Warrington, and Stonyhurst; on the 20th at Jersey, Clifton, Rose Hill, Stone, Cardington, and Bedford; on the 21st at Jersey; on the 23d at Bowdon, North Shields, Dunino, and Arbroath; on the 24th at Lewisham, Rose Hill, Stone, and Dunino; on the 27th at Aylesbury and Nottingham; on the 28th at Nottingham; on the 29th at Nottingham and Wakefield; and on the 30th at Hartwell Rectory, Linslade, Wakefield, and Stonyhurst.

Lightning was seen, but thunder was not heard, on the 8th April at Clifton; and on the 19th at North Shields. On the 16th May at Greenwich and Rose Hill. On the 7th June at Nottingham; on the 10th at Linslade; and on the 14th at Oxford.

Hail fell on the 1st April at Lewisham, Greenwich, Linslade, Nottingham, and Liverpool; on the 3d at Oxford and Stone; on the 7th at Rose Hill, Hawarden, Newcastle, and North Shields; on the 8th at Midhurst, Clifton, St. John's Wood, Stone, Linslade, Bedford, Holkham, Hawarden, Warrington, Manchester, Durham, Newcastle, North Shields, and Dunino; on the 12th at Oxford and North Shields; on the 13th at Guernsey, Midhurst, Clifton, Lewisham, Greenwich, Bicester, Oxford, Stone, Hartwell House, Hartwell Rectory, Aylesbury, Linslade, Royston, Cardington, Bedford, Norwich, Grantham, Holkham, Hawarden, Gainsborough, Warrington, Liverpool, and North Shields; on the 18th at Hawarden; on the 20th at Midhurst, Bicester, Stone, and Hartwell Rectory; on the 23d at Lewisham, Greenwich, Stone, Cardington, Hawarden, North Shields, and Arbroath; on the 24th at Jersey, Cardington, Norwich, Grantham, Gainsborough, Stonyhurst, Durham, Newcastle, and North Shields; on the 25th at Jersey, Guernsey, Ryde, Hartwell Rectory, Linslade, Grantham, Hawarden, Warrington, Liverpool, Manchester, North Shields, Dunino, and Arbroath; on the 26th at Helston, Bicester, Norwich, Grantham, Nottingham, Hawarden, Stonyhurst, and Dunino; on the 27th at Newcastle; and on the 30th at Liverpool. On the 7th May at Guernsey, Stone, Bedford, Holkham, Nottingham, Hawarden, Gainsborough, Warrington, Stonyhurst, Durham, North Shields, and Arbroath; on the 8th at Midhurst, Greenwich, Stone, Hartwell House, Hartwell Rectory, Aylesbury, Grantham, Hawarden, Gainsborough, Manchester, Stonyhurst, North Shields, and Arbroath; on the 9th at Helston, Exeter, Clifton, Lewisham, Greenwich, Bicester, Oxford, Stone, Hartwell House, Hartwell Rectory, Aylesbury, Linslade, Cardington, Grantham, North Shields, and Arbroath; on the 10th at Jersey, Lewisham, Gainsborough, North Shields, Dunino, and Arbroath; on the 11th at Dunino; on the 28th at Rose Hill and Oxford; and on the 29th at Lewisham, Greenwich, Oxford, and Linslade. On the 6th June at York; on the 14th at North Shields; on the 19th at Helston, Nottingham, Hawarden, and Warrington; on the 20th at Jersey and Guernsey; and on the 30th at Warrington.

Auroræ were seen on 5th April at Greenwich, Stone, Hartwell House, Hartwell Rectory, Cardington, Grantham, Nottingham, and Hawarden; on the 6th at Hawarden and Durham; on the 7th at Stone, Hartwell Rectory, and Hawarden; on the 8th at Hawarden, Stonyhurst, and Durham; and on the 24th at Hawarden. On 4th May at Hawarden and North Shields; on the 14th at Manchester; and on the 24th at Nottingham. On the 22d June at Greenwich.

Snow fell on the 8th, 13th, 22d, 23d, 24th, 25th, and 26th of April at various places. On the 7th May at Midhurst, Clifton, Rose Hill, Bicester, Oxford, Stone, Hartwell Rectory, Royston, Holkham, Nottingham, Hawarden, Warrington, Liverpool, Manchester, Wakefield, Stonyhurst, York, Durham, Newcastle, North Shields, and Arbroath; on the 8th at Midhurst, Greenwich, Oxford, Stone, Hartwell House, Wakefield, York, Newcastle, North Shields, Dunino, and Arbroath; on the 9th at Stone, Linslade, Nottingham, Hawarden, Gainsborough, Warrington, Liverpool, Manchester, Wakefield, Stonyhurst, York, North Shields, and Dunino; on the 10th at Stone, Hartwell Rectory, Grantham, Gainsborough, North Shields, and Dunino; on the 11th at Dunino; and on the 31st at Greenwich.

Fog was prevalent on 5 days in April, on 19 days in May, and on 10 days in June.

Solar Halos were seen on 14 days in April, on 13 days in May, and on 8 days in June.

Lunar Halos were seen on 7 days in April at the different stations, and on the 21st May at North Shields.

Lilac in flower on the 10th May at Guernsey; on the 15th at Jersey; on the 17th at Helston; on the 18th at Gainsborough; on the 21st at Oxford, Stone, and Wakefield; on the 22d at Rose Hill; on the 23d at Hartwell Rectory; on the 24th at Linslade, Hawarden, and Warrington; on the 28th at Nottingham; on the 29th at Bedford; and on the 30th at Cardington. On the 1st June at Grantham; on the 5th at North Shields; and on the 8th at Dunino.

Wheat in ear on the 9th June in the Isle of Wight; on the 11th at Helston; on the 14th at Aylesbury; on the 15th at Linslade, Cardington, and Bedford; on the 23d at Hawarden; and on the 27th at Nottingham.

Wheat in flower on the 13th June in the Isle of Wight; on the 18th at Aylesbury; on the 20th at Rose Hill; on the 24th at Jersey; on the 26th at Linslade and Grantham; on the 28th at Gainsborough; and on the 30th at Cardington, Bedford, and Nottingham.

The cuckoo was first heard on 16th April at Bicester; on the 18th at Hartwell Rectory and Gainsborough; on the 24th at Stone and Hartwell House; on the 28th at Nottingham; and on the 30th at Warrington.

Swallows were first seen on the 3d April at Stone; on the 7th at Hartwell Rectory; on the 16th at Bicester, Grantham, and Gainsborough; on the 17th at Royston; on the 22d at Nottingham and Warrington; and on the 30th at Guernsey and Clifton.

NAMES OF THE PLACES.	Mean Pressure of dry Air reduced to the level of the Sea.		Mean Temperature of the Air.		Highest Reading of the Thermometer.		Lowest Reading of the Thermometer.		Mean Daily Range of Temperature.		Mean Monthly Range of Temperature.		Range of Temperature in the Quarter.		Mean Temperature of Evaporation.		Mean Temperature of the Dew Point.		Mean estimated Strength.		WIND.		Rain.		Mean Weight of Vapour in a cubic foot of Air.		Mean additional Weight required to saturate a cubic foot of Air.		Mean degree of Humidity.		Mean whole Amount of Water in a vertical column of Atmosphere.		Mean Weight of a cubic foot of Air.		Height of Cistern of the Barometer above the level of the sea.

Southampton -	29°528	52°6	77°8	33°5	15°8	34°5	44°3	49°0	45°6	0°6	—	6°8	40	8°2	3°7																									

The mean of the numbers in the first column is 29·590 inches, and it represents that portion of the reading of the barometer due to the pressure of air; the remaining portion, or that due to the pressure of water, is 0·210 inch; the sum of these two numbers is 29·800 inches, and it represents the mean reading of the barometer for the quarter at the level of the sea.

The highest readings of the thermometer in air were 84°O at Bicester, 82°O at Lewisham and Nottingham, $81^{\circ}\cdot 7$ at Royston, and $81^{\circ}\cdot 5$ at Cardington.

The lowest readings were $28^{\circ}0'$ at York, $28^{\circ}6'$ at Nottingham, $28^{\circ}7'$ at Stonyhurst, $28^{\circ}8'$ at Manchester, and $28^{\circ}9'$ at Warrington. The least daily ranges of temperature took place at Guernsey, North Shields, Ventnor, and Worthing; and the greatest at Aylesbury, Nottingham, and Bicester.

Rain fell on the least number of days at York, Guernsey, Dunino, Jersey, and Arbroath; and on the greatest number at Royston, North Shields, Stone, and Nottingham. The least falls took place at Dunino, Arbroath, Newcastle, York, and Holkham; and the mean amount at these places is 4·4 inches. The largest falls occurred at Clifton, Linslade, Stonyhurst, Rose Hill, and Aylesbury, and their mean is 8·9 inches.

QUARTERLY METEOROLOGICAL TABLE for different PARALLELS of LATITUDE.

PARALLELS OF LATITUDE, &c.	Mean Temperature of the Air.		Mean of Highest Readings of the Thermometer.		Mean of Lowest Readings of the Thermometer.		Average Daily Range of Temperature.		Average Monthly Range of Temperature.		Average Quarterly Range of Temperature.		Mean Temperature of Evaporation.		Mean Temperature of the Dew Point.		Mean Amount of Cloud.	RAIN.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.	Mean Height above the Sea level.
	Average Number of Days.	Average fall.	in.	gr.	in.	gr.	in.	gr.	in.	gr.	in.	gr.	in.	gr.	in.	gr.		in.	gr.						
In the Counties of Cornwall and Devonshire	43	7	5	3	8	1	0	790	4	5	534	132													
Newport and Ryde	43	8	0	3	7	1	0	793	4	4	536	69													
South of latitude 51°	42	7	7	3	7	0	9	806	4	4	536	43

Between the latitudes of 52° and 53°	43	6	5	3	6	0	9	799	4	3	535	140													
Between the latitudes of 53° and 54°	41	6	9	3	4	1	0	779	4	2	535	142													
Liverpool	38	5	7	3	8	0	9	805	4	5	535	37													
Newcastle and North Shields	44	5	1	3	6	0	5	833	4	3	538	123													
Dunino and Arbroath	39	2	8	3	1	1	1	0	739	3	7	534	150												

In the formation of this Table the results from Jersey and Guernsey have not been combined, on account of the difference between the ranges of temperature of the two places. The results from Ventnor are not combined, on account of the much higher temperature, and less range of temperature than those at the other stations in the Isle of Wight.

MONTHLY METEOROLOGICAL TABLE FOR THE QUARTER ENDING JUNE 30th, 1853.
The Observations have been reduced to Mean values, and the Hygrometrical results have been deduced — from Glaisher's Tables.

Year 1853.	Months.	Air and Water.		Mean Pressure of		Temperature of the Air.					Mean Temperature of		Wind.		Rain.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean Degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.	
		or Mean Reading of the Barometer.	Water or Elastic Force of the Vapour.	Barometer in the Month.	From Dry Thermometer.	From Self-registering Therm.	Adopted.	Highest.	Lowest.	Range in the Month.	Mean of all the Days.	Evaporation.	Dew Point.	Estimated Strength.	Direction.	Mean Amount of Cloud.						Number of Days it fell.

Alderley Edge.—The observations in April were taken on 20 days only. Wakefield Prison.—April; the reading of the dry bulb thermometer on the 20th at 3h. p.m. has been altered from 35° to 55°. June; the reading of the barometer on the 1st at 9h. p.m. has been altered, conjecturally, from 30°·840 in. to 30°·040 in. Arbroath.—No subsequent use has been made of the barometer reading on account of its construction not admitting of accurate results.

NOTE.—Second rain gauges are placed: At Jersey at the height of 6 feet; the amount collected was 5·8 inches. At Newport, 3 feet; the amount was 7·8 inches. At Clifton, 50 feet; the amount was 8·9 inches. At Oxford, 22 feet; the amount was 6·6 inches. At Hartwell Rectory, 4 feet; the amount was 7·9 inches. At Cardington, 36 feet; the amount was 5·1 inches. At Ilkham, 4 feet; the amount was 4·6 inches. At Nottingham, 25 feet; the amount was 7·4 inches. And at Warrington, 34 feet; the amount was 5·8 inches.

OF

THE MARRIAGES, BIRTHS, AND DEATHS

IN ENGLAND.

THIS Return comprises the BIRTHS and DEATHS registered by 2191 Registrars in all the districts of England during the summer quarter ending September 30th, 1853; and the MARRIAGES in 12039 churches or chapels, about 3424 registered places of worship unconnected with the Established Church, and 625 Superintendent Registrars' offices, in the quarter that ended June 30th, 1853.

The Return of Marriages is not complete; but the defects are inconsiderable, and approximative numbers have been supplied from the records of previous years.

The marriages exceeded the average in the quarter ending in June. For the quarter that ended in September 30th the births have also been above the average number, while the deaths have been fewer than is usual in proportion to the population. The mortality of the town population has experienced a marked diminution during the summer; but one town has suffered severely, and others are threatened by Asiatic cholera.

MARRIAGES.

40335 marriages were celebrated in the quarter that ended in June 1853; a number exceeding by 328 the marriages in the corresponding quarter of the

MARRIAGES, BIRTHS, and DEATHS, returned in the Years 1841-53 and in the Quarters of those Years.

* The numbers up to 1851 have appeared in the Annual Reports.

previous year. The marriages in the spring quarter have thus gradually risen from 30048 in 1842 to 40335 in 1853. The increase of marriages within the last five years is particularly conspicuous in London, Cornwall, Staffordshire, Cheshire, Monmouthshire, and South Wales.

BIRTHS.

147581 births were registered in the quarter ending September 30th. This is above the average number; but it is less by 3612 than the numbers (151193) which were registered in the corresponding quarter of 1852. The decrease is, singularly enough, observable in every county except Middlesex, Surrey, Cornwall, Staffordshire, Rutlandshire, Cheshire, Lancashire, Cumberland, and Monmouthshire.

INCREASE OF POPULATION.

As 147581 births and only 92332 deaths were registered, a balance of 55249 remains in the population. The births and deaths are not registered in Scotland and Ireland, as they are in nearly all other civilized countries, so that the increase of the population of the United Kingdom cannot be ascertained; but if the excess of births in those divisions of the United Kingdom bears the same proportion to the population as it does in England and Wales, the increase by natural causes must be about 83000. But 87467 emigrants sailed from the ports of the United Kingdom at which there are Government Emigration Agents in the quarter ending September 30th, 1853; so that allowing on one hand for births unregistered, on the other for emigrants unreturned, it is probable that the population of the United Kingdom has declined rather than increased during the summer. 13623 of the emigrants sailed from London, Plymouth, and Southampton; 63600 from Liverpool; 2807 from Glasgow and Greenock; 7437 from Irish ports.* As a large proportion of the emigrants

† The Table may be read thus, without reference to the decimal points:—In the year 1848, to 100000 of the population of England there were 798 marriages, 3249 births, 2307 deaths registered.—The annual rates of marriage in each of the 4 quarters were ·661, ·805, ·755, and ·961 per cent.; the rates of death 2·794, 2·313, 2·005, and 2·108 per cent. In reading the population on the first line add 3 ciphers (000). The 3 months January, February, March, contain 90, in leap year 91 days; the 3 months April, May, June, 91 days; each of the 2 last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

* Return with which the Registrar General has been favoured by the Emigration Commissioners.

from Liverpool, as well as from the Irish ports, are natives of Ireland, it follows that the population of Ireland is decreasing, and that the population of England is slowly increasing, while the contributions of both countries within the last three years to the colonial plantations are without example.

Prices of Provisions.

It will be seen in the annexed Table that the prices of the chief articles of food are much higher than they were in the corresponding quarter of the last year; the rise in the price of *wheat* is 26, mutton 23, beef 24, potatoes 31 per cent.

The *rate* of wages has been raised in several trades; and at the same time the labourers and artizans have been more fully employed.

The AVERAGE PRICES of Consols, of Wheat, Meat, and Potatoes; also the AVERAGE QUANTITY of Wheat sold and imported weekly, in each of the Nine Quarters ending September 30th, 1853.

† *Note.*—The total number of quarters of wheat sold in England and Wales for the 13 weeks ending Sept. 30th, 1851, was 971,276; for the 13 weeks ending Dec. 31st, 1,423,582; for the 13 weeks ending March 31st, 1852, 1,241,921; for the 13 weeks ending June 30th, 1,143,339; for the 13 weeks ending Sept. 30th, 1,023,251; for the 13 weeks ending Dec. 31st, 1,445,906; for the 13 weeks ending March 31st, 1853, 1,236,493; for the 13 weeks ending June 30th, 1853, 1,099,261; for the 13 weeks ending Sept. 30th, 1853, 1,119,128. The total number of quarters entered for Home Consumption was respectively 1,183,523; 671,803; 358,024; 710,780; 882,850; 947,310; 825,886; 1,074,095; and 1,560,255; the second total, however, embraces the returns of 14 weeks.

The low temperature, the excess of rain, the cloudy sky, and the other meteorological phenomena of the quarter are ably described by Mr. Glaisher. See pp. 30, 31.

STATE OF THE PUBLIC HEALTH.

92332 deaths have been registered during the quarter; a number less by 8165 than the number of persons (100497) whose deaths were recorded in the summer quarter of 1852. The depression of the mortality extended over nearly every county except Durham and Northumberland; and indeed over all except a few districts of those counties.

A similar depression of the mortality was observed in the summer quarter of 1848, immediately before the outbreak of the epidemic cholera.

The mortality during the quarter of the districts comprising the chief towns and a population of 7795882 was at the rate of 2·4 per cent. per annum nearly ; the mortality of the districts of small towns and country parishes was at the rate of 1·7 per cent. The average rates are higher ; or 2·6 and 1·9 per cent.

The number of deaths in LONDON was 12918, which is below the average. The deaths by zymotic disease were 3456, including 1232 by diarrhœa, and 137 by cholera. The deaths by diarrhœa were 200 less than in either of the summer quarters of the preceding years ; and the deaths from cholera did not exceed the average of the 3 preceding summer quarters. 585 deaths were referred to typhus ; and over the country scarlatina prevailed with great severity in several districts. The local epidemics are indicated in the Registrars' reports.

The appearance of the Asiatic cholera in London, and the terrific mortality which it has occasioned within a few weeks in the north of England, are of such importance as to demand the whole of our attention.

As a means of guidance and a basis of reasoning it may be useful to present here a brief summary of the facts which regulated the course of the epidemic that broke out 5 years ago.

The Cholera.

Evident cases of the epidemic of 1848-49 were registered in London and in Sunderland during the first week of October. The deaths from cholera in all England were 1105 during the last three months of the year. The epidemic declined, and in April 1849 the deaths were only 107 ; in May 327. The great epidemic eruption began ; and in June 2046 persons died of it, July 7570, August 15872, September 20379, October 4654, November 844, December 163. The thirty-sixth and thirty-seventh weeks of the year 1849 were the most fatal ; the deaths from cholera in those two weeks were 12592. On the most fatal day, September 6th, the deaths by the disease were 1121.

The total deaths from cholera in 1849 were 53293. 12152 of the number were of persons under 10 years of age. The mortality by the disease was at the rate of 30 in 10000 of the inhabitants. Diarrhœa of a severe form was fatal in the same year to 18887 persons, chiefly children ; or to 11 in 10000 of the inhabitants.

The danger of dying by the epidemic was greatest at advanced ages ; the rate of mortality was 13 in 10000 at the age of 12 ; 64 in 10000 at the age of 70 ; the danger advancing progressively with age.

The duration of the fatal attacks of cholera is recorded in 39468 cases ; and it was found to be 50 hours on an average. More than half of the cases (20684) terminated within 24 hours.

In 85 of the 623 districts of England no death from cholera was recorded.

Only one death was referred to cholera in Herefordshire, and one in Westmoreland. The centres of the attacks of the great epidemic were London, Portsmouth, Plymouth, Bristol, Merthyr Tydfil, Wolverhampton, Liverpool, Hull, and Tynemouth.

In the following districts the rate of mortality by cholera exceeded 100 to 10000 inhabitants:— It was in Hull 241, Merthyr Tydfil 234, Stoke Damerel 193, Salisbury 185, Neath 169, Liverpool 167, Plymouth 167, Sculcoates 152, East Stonehouse 148, Leeds 145, St. Germans 143, Wolverhampton 137, Tynemouth 129, Gravesend 119, Newcastle-under-Lyme 117, Hunslet (near Leeds) 102. The districts which in London were most fatal were Rotherhithe 205, St. Olave 181, St. George Southwark 164, Bermondsey 161, St. Saviour 153, Newington 144, Lambeth 120. It was in Wandsworth 100.

The mortality was at the rate of 50 in 10000 on the coasts; 17 in 10000 over the inland districts. It was at the rate of 125 in 10000 in the districts including the large ports; 47 in the districts of the secondary ports; 15 in the other coast districts.

Of the inhabitants of low river and seaside districts, 85 in 10000 died by cholera; in London the loss was 62; in inland towns 38; in small towns and the country around the river sources only 12 in 10000 perished. Of the inland towns, Wolverhampton, Merthyr Tydfil, Manchester, and Leeds experienced the greater part of the mortality; in the 35 other large inland towns the mortality was at the low rate of 11 in 10000.

In London the water supply had considerable influence on the mortality. The density of population and the poverty of the inhabitants were not without effect, but the effect of elevation of the soil transcended all other influences. On an average the mortality by cholera was in the several London districts at elevations of less than 20 feet above Trinity high-water mark, 102 in 10000; in the districts at an elevation of 20–40 feet, 65 in 10000; of 40–60 feet, 34; of 60–80 feet, 27; of 80–100 feet, 22; of 100 feet, 17; of 350 feet, 8 in 10000 inhabitants.

The present epidemic has appeared first, like all that have preceded it, in the seaports. The first well-defined cases in London were registered in August, and the epidemic may be dated from August 20th; up to October 1st the registered deaths, including some by English cholera, have amounted to 133. The origin of the last epidemic may be dated from October 1st, 1848; and that of 1831–32 also began in the month of October 1831. The present epidemic has attacked us earlier in the year, but it has not yet in the aggregate been more fatal in London than it was during the same number of weeks in 1848.

In Newcastle-upon-Tyne, with a population of 89156 in 1851, the mortality from cholera has raised the deaths by all causes from 638 to 2085; in Gateshead from 374 to 771 in three months.* The epidemic poison was no sooner introduced into the region than it, as it were, exploded, and destroyed nearly 2000 lives.

In neither of the previous epidemics was any such sudden destruction of life observed. Is the present epidemic—so quickly following the epidemic of 1848–9—of a different and more fatal character? or are there local circumstances, independently of the nature of the epidemic, that account for the desolation that now surrounds Newcastle-upon-Tyne? These important questions can, it is evident,

* NEWCASTLE-UPON-TYNE. DEATHS from all causes registered in each of the 4 quarters of the years 1848–53.

only be definitively answered by careful inquiry into all the circumstances ; but enough has been elicited to justify us in refusing to admit at present that the epidemic is in its nature more destructive than its predecessors ; while it yields an awful sanction to the hygienic law, which prohibits the use of impure water.

The Superintendent Registrars of Newcastle and Gateshead, in reply to inquiries which the Registrar General has made, state, and have forwarded documents showing, that from the 5th of July last the town, which had been supplied before with salubrious water, was supplied largely "from the impure source of the Tyne, in the vicinity of the sewerage of the town." *

The fact cannot be questioned that the water with which Newcastle-upon-Tyne was supplied in 1848-9 was comparatively pure ; and that in 1853, when the calamitous loss of life was recorded on the registers, the city was supplied with water containing a strong solution of the contents of the sewers. The same effect was the result of the same cause in Hull in 1849. And other examples may be cited in which the converse happened, as at Exeter, where the inhabitants, after having suffered severely from cholera in 1832, obtained pure water, and escaped its ravages in 1848-9.

In the East and in Europe observation has shown that the cholera poison, be it what it may, is conveyed by water as well as air ; hence the following precaution was cited in the Cholera Report :

"The precautions to take against cholera, in regard to *water*, are well stated by Dr. Snow ; and they are of so simple a nature that, considering all the facts, no person can prudently neglect them.

"*Water into which sewers flow, or which is navigated by persons living in boats, or which is in any other way contaminated by the contents of drains or cesspools, should be entirely disused.*"

No person, to test the value of such a rule, would ever have proposed that a large town which was supplied with good water, and escaped with no considerable loss in a previous epidemic, should on the eve of another epidemic do all that is here forbidden. What no sceptical philosopher would have dared to propose as an experiment, what no haughty conqueror ever condemned the inhabitants of a subjugated city to endure,—this fine English town on the Tyne—the centre of the coal trade—of intelligence of every kind—and of engineering knowledge—has done and suffered. All the excreta, which are thrown into the streets or water-closets, are washed down the acclivities of the streets into the river ; the fermenting mass is driven up and down by the tides, and has thence since July been pumped by the engine at Elswick all over the town through the water pipes for domestic uses : it has been used for ablution, it has been washed over the floors, it has been drunk as a beverage by many of the children and the wives, as well as large numbers of the higher and middle as well as the working men of the town. This sad fact in the history of Newcastle will be remembered when the loss of 1500 lives, by which it was followed, is forgotten.

No water was drawn from the Tyne after September 15th, the cholera then raged with less intensity, and the epidemic speedily subsided.

The intensity of the epidemic at Newcastle-upon-Tyne is, under the circumstances, no decisive proof that in its essential form cholera is now more fatal than it was before ; but it is unquestionably a Warning to those towns which derive their water from polluted tidal rivers to abandon such sources, and to accelerate their works for supplying the population with pure water before June next, otherwise the death registers may, it is to be feared, be filled with the names of innumerable victims of a practice, which is as degrading as it is destructive to the English nation.

* The Newcastle water taken from the River Tyne has been analysed by Dr. Robert Dundas Thomson. He found it to contain a quantity of organized matter mechanically diffused through it (loaded with living vibrios) to the amount of 4.502 grs. per gallon. Of this 0.545 grs. was destructible matter ; the remaining 3.957 grs. consisted of silicious forms resembling the shields of infusorial animals or diatomaceous plants. Dissolved or finely diffused in the water, he further found 2.68 grs. per gallon of organic matter. The water likewise contained 1.18 gr. per gallon of chalk and 7.3 grs. of muriate and sulphate of soda and sulphate of magnesia. The total solid contents were 15.662 grs. per gallon. This water was, it is said, filtered, but the process is not described by the Water Company.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle has been adopted of placing a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties differ more or less from the boundaries of the Counties proper.

NOTE.—The 13 weeks of 1853, constituting the September quarter in the Weekly Tables of Mortality, ended September 24th in which 12918 deaths were registered. In the quarter ending September 30th (p. 7), 13185 deaths were registered.

* Under the head of sudden deaths are classed not only deaths described as sudden, of which the cause has not been ascertained or stated; but also all deaths returned by the coroner in vague terms, such as "found dead," "natural causes," &c. &c.

On the Meteorology of England and Scotland, during the Quarter ending September 30th, 1853. By JAMES GLAISHER, ESQ., F.R.S., Sec. of the British Meteorological Society.

The daily temperatures have been below their averages throughout the quarter, with few and trifling exceptions. The month of July was wet; the fall of rain exceeded the double of the average fall for this month. The sky was cloudy. The first half of August was fine and dry, and was the only fine weather in the quarter. From the middle of August to the end of September the sky was mostly cloudy, the air damp, with a thick and hazy atmosphere. The motion of the air was less than its average. During parts of the month of September different places in England and Scotland were visited by numerous swarms of a black fly (*Aphis Fabœ*); their appearance in a locality was sudden, and they continued till a brisk wind arose and carried them suddenly away. The numbers of these insects was extraordinary, and they were very annoying by settling in great numbers upon the face and hands.

The mean temperature of the air at Greenwich for the quarter ending August, constituting the 3 summer months, was $59^{\circ} \cdot 5$, being $0^{\circ} \cdot 4$ below the average of 80 years.

NOTE.—In reading this table it will be borne in mind that the sign (–) minus signifies below the average, and that the sign (+) plus signifies above the average.

Thunderstorms occurred, or thunder was heard and lightning seen, on the 1st July at Hartwell House, Linslade, Cardington, Bedford, Holkham, and Dunino; on the 6th at Ryde; on the 7th at Jersey, Guernsey, Exeter, Newport, Worthing, Clifton, St. John's Wood, Rose Hill, Bicester, Oxford, Stone, Hartwell House, Hartwell Rectory, Aylesbury, and Linslade; on the 8th at Helston, Greenwich, Stone, and Hartwell House; on the 9th at Jersey, Helston, Linslade, Norwich, Hawarden, Warrington, Liverpool, Manchester, and Stonyhurst; on the 13th at Jersey, Oxford, Stone, Hartwell House, Hartwell Rectory, Hawarden, and Liverpool; on the 16th at Gainsborough; on the 17th at Rose Hill, Bicester, Oxford, Stone, Royston, and Grantham; on the 18th at Hartwell House, Hartwell Rectory, Aylesbury, Royston, Cardington, North Shields, and Dunino; on the 19th at Royston; on the 22d at York; on the 26th at Bedford; on the 27th at Guernsey and Newport; and on the 28th at Lewisham and Greenwich. On the 19th August at Norwich and Dunino; on the 25th at Exeter; and on the 26th at Helston, Midhurst, Clifton, Durham, and Dunino. On the 1st September at Rose Hill, Bicester, Oxford, Hartwell House, Aylesbury, Cardington, Hawarden, Gainsborough, Warrington, and Manchester; on the 10th at Grantham, Gainsborough, and Stonyhurst; and on the 24th at Rose Hill, Bicester, and Oxford.

Thunder was heard, but lightning was not seen, on the 1st July at Exeter, Bicester, Stone, Hartwell Rectory, and North Shields; on the 7th at St. John's Wood, and Holkham; on the 8th at Helston and Holkham; on the 9th at Helston, Stone, Hartwell Rectory, Cardington, and Holkham; on the 10th at Ryde; on the 12th at North Shields; on the 13th at Guernsey, Rose Hill, Bicester, Cardington, and Warrington; on the 14th at Grantham and Wakefield; on the 15th at Greenwich; on the 16th at Grantham; on the 17th at Hartwell House and Hartwell Rectory; on the

18th at Rose Hill, Bicester, Stone, Grantham, Gainsborough, and Dunino; on the 19th at Hartwell House and Cardington; on the 26th and 27th at Guernsey; and on the 28th at Cardington. On the 21st August at Bicester; on the 23d at Wakefield; on the 25th at Grantham; on the 26th at Midhurst, Royston, Stonyhurst, and North Shields; on the 27th at Wakefield; and on the 30th at Warrington. On the 1st September at Stone, Hartwell Rectory, and Grantham; on the 10th at Cardington, Grantham, and Wakefield; on the 24th at Lewisham, Greenwich, Stone, and Hartwell Rectory; on the 25th at Helston and Aylesbury; and on the 30th at Stone.

Lightning was seen, but thunder was not heard, on the 7th July at Helston, Oxford, and Cardington; on the 8th at Rose Hill, Bicester, Oxford, and Cardington; on the 15th at Stone; on the 18th at Newcastle; and on the 27th at Greenwich, Aylesbury, and Linslade. On the 19th August at Stone and Hartwell Rectory; on the 25th at Helston; on the 26th at Helston and Newcastle; on the 27th at Grantham; and on the 30th at Hawarden, Warrington, Liverpool, and Wakefield. On the 1st September at Midhurst, Greenwich, Stone, Hartwell Rectory, Aylesbury, Royston, Cardington, Bedford, Grantham, Wakefield, Stonyhurst, and York; on the 15th at Truro; on the 24th at Hartwell Rectory; and on the 25th at North Shields.

Hail fell on the 16th July at Aylesbury and Grantham; on the 17th at Stone, Hartwell House, and Hartwell Rectory; and on the 30th at Manchester. On the 1st September at Cardington and Bedford; on the 23d at Stonyhurst; on the 24th at Rose Hill, Oxford, Hartwell Rectory, Stonyhurst, and North Shields; on the 25th at Ryde and Liverpool; on the 26th at Liverpool; and on the 30th at Stonyhurst.

Remarkable falls of rain on the 9th July at Helston was 1.5 in., at Norwich 1.6 in., at Hawarden 3.6 in., at Warrington 1.4 in., at Liverpool 2.0 in., at Stonyhurst 1.6 in., and at North Shields 2.1 in.; on the 10th at Falmouth 1.2 in. and at Truro 1.7 in.; on the 13th at Bedford 1.7 in. and at Holkham 1.4 in. in 7 hours; on the 14th at Ryde 1.5 in., at Worthing 1.2 in., at Clifton 1.8 in., at Lewisham 2.8 in. in 17 hours, at Greenwich 2.6 in., at St. John's Wood 1.3 in., at Rose Hill 1.7 in. in a few hours, at Bicester 1.5 in., at Stone 1.8 in., at Hartwell Rectory 2.0 in., at Aylesbury 2.3 in. in 8 hours, at Linslade 1.8 in. in 12 hours, at Royston 1.5 in., at Grantham 1.2 in., at Hawarden 1.3 in., and at North Shields 1.0 in.; on the 15th at Stonyhurst 1.4 in., and at Arbroath 1.0 in.; and on the 28th at Lewisham 1.0 in., at Greenwich 1.1 in., of which 0.25 fell in 20 minutes, and at St. John's Wood 1.0 in. On the 17th August at Grantham 1.6 in., at Holkham 1.6 in. in 10 hours, at Hawarden 1.3 in., and at Alderley Edge 1.2 in.; on the 20th at Greenwich 0.25 in. fell in 5 minutes, and on the 22d 0.72 in. fell in 10 hours; on the 23d at Worthing 1.2 in.; on the 25th at North Shields 1.1 in.; on the 26th at Stone 1.1 in., and at Hartwell Rectory 1.1 in.; and on the 27th at Clifton 1.4 in. On the 1st September at Guernsey 1.0 in. in 9 hours, and at North Shields 1.0 in.; on the 10th at Gainsborough 1.0 in.; on the 12th at Wakefield 1.1 in. and at North Shields 1.6 in.; on the 13th at Clifton 1.0 in.; on the 25th at Stonyhurst 1.0 in.; and on the 27th at Holkham was 0.8 in. in 6 hours.

Fog was prevalent on the 20th July at Bicester, Stone, Hartwell House, and Hartwell Rectory. On the 5th August at Stone and Hartwell House; on the 6th at Hartwell House; on the 10th at Bicester; on the 11th at Bicester, Stone, and Hartwell House; on the 18th at Stone and Hartwell Rectory; on the 19th at St. John's Wood; on the 23d at Midhurst and Linslade; and on the 24th at Lewisham, Greenwich, St. John's Wood, Stone, Hartwell House, and Hartwell Rectory. On the 5th September at Manchester; on the 6th at Clifton; on the 7th at Gainsborough and Manchester; on the 8th at Clifton; on the 9th at St. John's Wood and Wakefield; on the 11th at Lewisham, Greenwich, St. John's Wood, Bicester, Stone, Hartwell Rectory, Grantham, Gainsborough, and North Shields; on the 14th at Clifton, Lewisham, Bicester, Stone, Hartwell House, Hartwell Rectory, Wakefield, and North Shields; on the 16th at Midhurst, Lewisham, Greenwich, Stone, Hartwell Rectory, Grantham, Gainsborough, and North Shields; on the 17th at Clifton, Stone, Hartwell House, Hartwell Rectory, Grantham, Gainsborough, and North Shields; on the 18th at Stone, Hartwell House, Hartwell Rectory, and Grantham; on the 19th at Clifton; on the 20th at Midhurst, Bicester, and Linslade; on the 21st at Bicester, Stone, Hartwell House, and Hartwell Rectory; on the 24th at Bicester; on the 27th at Midhurst; and on the 29th at Lewisham and Greenwich.

Snow fell on the Grampians on the 25th September.

Auroræ were seen on 12th July, 20th, 26th, and 30th August at Hawarden; and on the 31st at Arbroath. On the 1st September at Greenwich; on the 2d at Exeter, Clifton, Greenwich, Hawarden, Warrington, Liverpool, Manchester, York, Durham, and Dunino; on the 3d at Clifton; on the 8th at Arbroath; and on the 28th at Durham.

Solar Halos were seen on 20 days during the quarter.

Mock Sun was seen on the 29th September, about 8h. 45m. A.M. at Stone and Hartwell Rectory.

Lunar Rainbow was seen on the 25th September, at 9h. 30m. P.M. at Durham.

Wheat began to be gathered on the 6th August at Exeter; on the 7th at Guernsey; on the 8th at Stone, Hartwell Rectory, and Cardington; on the 9th at Holkham; on the 10th at Grantham; on the 11th at Hawarden and Gainsborough; on the 14th at Rose Hill; on the 18th at Warrington; and on the 26th at Dunino.

The wheat crop was small in breadth, and rather light; it was generally of good quality; a good part was spring sown. *Oats* not very good, and a good deal carried unripe. *Potatoes* diseased everywhere. *Harvesting operations* late.

Bicester - - - - -	—	59																											

The mean of the numbers in the first column is 29.547 inches, and it represents that portion of the reading of the barometer due to the pressure of air; the remaining portion, or that due to the pressure of water, is 0.299 inch; the sum of these two numbers is 29.846 inches, and it represents the mean reading of the barometer for the quarter at the level of the sea.

The highest readings of the thermometer in air were $84^{\circ}0$ at Ryde and Aylesbury, $83^{\circ}0$ at Bicester and Hartwell House, $82^{\circ}8$ at Lewisham and $82^{\circ}3$ at Bedford. The lowest were $33^{\circ}5$ at Nottingham, $34^{\circ}5$ at Aylesbury and Wakefield, $35^{\circ}0$ at Derby, and $35^{\circ}5$ at Cardington.

The least daily ranges of temperature took place at Durham, Guernsey, Ventnor, Liverpool, and Worthing; and the greatest at Aylesbury, Bicester, Linslade, St. John's Wood, and Hartwell House.

Rain fell on the least number of days at Southampton, Bicester, Newcastle, Guernsey, Dunino, and Liverpool; and on the greatest number at Warrington, Wakefield, Hawarden, North Shields, Falmouth, Clifton, Oxford, Stone, and Hartwell Rectory.

The least falls took place at York, Southampton, Bicester, Bedford, Cardington, Royston, Wakefield, Durham, and Arbroath; and the mean amount at these places is 6·4 inches. The largest falls occurred at Stonyhurst, Clifton, Hawarden, North Shields, Lewisham, and Greenwich, and their mean is 11·7 inches.

QUARTERLY METEOROLOGICAL TABLE for different PARALLELS of LATITUDE.

PARALLELS OF LATITUDE, &c.																		
	Mean Temperature of the Air.		Mean of Highest Readings of the Thermometer.		Mean of Lowest Readings of the Thermometer.		Average Daily Range of Temperature.		Average Monthly Range of Temperature.		Average Quarterly Range of Temperature.		Mean Temperature of Evaporation.		Mean Temperature of the Dew Point.		Mean Amount of Cloud.	
	Average Number of Days.		Average fall.		RAIN.		Mean Weight of Vapour in a cubic foot of Air.		Mean additional Weight required to saturate a cubic foot of Air.		Mean degree of Humidity.		Mean whole Amount of Water in a vertical column of Atmosphere.		Mean Weight of a cubic foot of Air.		Mean Height above the Sea level.	
	in.		gr.		in.		gr.		in.		gr.		in.		gr.		feet.

Dunino and Arbroath	53°	573°	5°	36°	5°	16°	1°	29°	37°	0°	51°	3°	47°	5°	5°	7°	38	8°

In the formation of this Table the results from Jersey and Guernsey have not been combined, on account of the difference between the ranges of temperature of the two places. The results from Ventnor are not combined, on account of the much higher temperature, and less range of temperature than those at the other stations in the Isle of Wight. The results from Chiswell-street Brewery have also not been combined.

MONTHLY METEOROLOGICAL TABLE FOR THE QUARTER ENDING SEPTEMBER 30th, 1853.

The Observations have been reduced to Mean values, and the Hygrometrical results have been deduced—from Glaisher's Tables.

Year 1853.	Months.	Names of Stations and Observers.	Mean Pressure of		Temperature of the Air.						Wind.		Mean Amount of Cloud.		Rain.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean Degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.	
			Air and Water, or Mean Reading of the Barometer.	Water or Elastic Force of Vapour.	Range of Barometer Readings in the Month.	Mean.			Direction.	Amount collected.	Number of Days it fell.	Amount collected.										
						From Dry Bulb Thermometer.	From Self-registering Thermometer.	Adopted.					Highest.	Lowest.	Range in the Month.	Mean of all the Highest.						Mean of all the Lowest.

Holkham.—July; the reading of the barometer is too high;—it should be about 29.840 in. Gainsborough.—September; the reading of the barometer seems to be a tenth of an inch too small. Highfield House.
 —August; the reading of the barometer is too high; it should be about 29.800 in. Alderley Edge.—25th September, 7 h. 30 m. A.M.; the reading of the barometer 29.884 in. has been altered to 28.884 in.
 Durham.—The readings of the barometer are discordant; the mean reading for August is certainly too high.

NOTE.—Second rain gauges are placed: At Jersey at the height of 6 feet; the amount collected was 7.7 inches. At Newport, 3 feet; the amount was 7.5 inches. At Clifton, 50 feet; the amount was 11.4 inches. At Oxford, 22 feet; the amount was 7.5 inches. At Hartwell Rectory, 4 feet; the amount was 9.1 inches. At Cardington, 36 feet; the amount was 4.3 inches. At Holkham, 4 feet; the amount was 8.3 inches. At Nottingham, 25 feet; the amount was 8 inches. And at Warrington, 34 feet; the amount was 9.4 inches.

OF

THE MARRIAGES, BIRTHS, AND DEATHS
IN ENGLAND.

THIS Return comprises the BIRTHS and DEATHS registered by 2191 Registrars in all the districts of England during the autumn quarter ending December 31st, 1853; and the MARRIAGES in 12039 churches or chapels, about 3454 registered places of worship unconnected with the Established Church, and 625 Superintendent Registrars' offices, in the quarter that ended September 30th, 1853.

The Return of Marriages is not complete; but the defects are inconsiderable, and approximative numbers have been supplied from the records of previous years.

The *marriages* in the quarter that ended on September 30th are not only above the average, but the proportion to the population exceeds any of the proportions previously recorded. The *births* in the quarter that ended on December 31st are also above the average. The *mortality*, particularly in towns and cities, is high, and exceeds the mortality in every autumn quarter since 1843, except in 1846, 1847, when the potato disease commenced, and diarrhœa and influenza became epidemic.

The returns, therefore, present a mixed result: the marriages indicate that the circumstances of the great body of the people were considered by them prosperous. But the public health has suffered, and is still over the coming year threatened by Asiatic cholera. All the measures of improvement should therefore be accelerated.

It will be a happy circumstance if the germs of diseases which first affected the potato and the vine, and other plants, in the year of high temperature 1846, and have led to the loss of so much food, should be partially destroyed by the severe cold that set in at the close of the year.

MARRIAGES, BIRTHS, and DEATHS, returned in the Years 1841-53 and in the Quarters of those Years.

* The numbers up to 1851 have appeared in the Annual Reports.

MARRIAGES.

79572 persons were married during the quarter ending September 30th, 1853,—a number considerably exceeding that of any corresponding quarter since the Registration Act came into operation in 1837, and 2990 more than were married in the same period of 1852, when the large number of 76582 persons were married.

The increase was spread over each of the eleven divisions of England and Wales, and the only counties in which a decrease is observable are Hampshire, Berkshire, Northamptonshire, Huntingdonshire, Bedfordshire, Dorsetshire, Devonshire, Somersetshire, Leicestershire, Rutlandshire, Derbyshire, Cheshire, and Westmorland. Marriages increased in most of the important seats of manufactures and commerce, but an augmented number is more particularly apparent in the mining districts of Cornwall and South Wales, of Staffordshire and Durham. In the September quarter of the last five years, the number of marriages was, in Truro, 76, 90, 80, 91, and 134; in Redruth, 101, 95, 127, 112, and 143; in Wolverhampton, 188, 256, 287, 289, and 313; Walsall, 57, 87, 97, 88, and 107; West Bromwich, 157, 191, 158, 179, and 225; Dudley, 265, 313, 294, 326, and 430; Stockton, 104, 115, 107, 126, and 132; Sunderland, 161, 193, 191, 197, and 240; South Shields, 72, 74, 104, 90, and 109; and in the districts of Cardiff, Merthyr Tydfil, Bridgend, and Neath, 360, 437, 424, 501, and 580 marriages were celebrated in the September quarter of the past five years. In Preston, the number of marriages (252) is slightly in excess of the number (244) recorded in the third quarter of the previous year, although fewer than in the corresponding periods of 1850 and 1851, when the numbers reached 281 and 277 respectively. On an average of the corresponding quarters of 10 years (1843–1852), the number of marriages was at the annual rate of 788 to every 100000 persons living; the proportion for the same period of 1853 was 867 to 100000 persons living.

BIRTHS.

144444 births were registered in the last 3 months of the year. This number, though slightly above the average, shows a considerable diminution on the numbers registered in the same period of the 2 preceding years (148912 and 152066 respectively). This decrease is observable in nearly the whole of the country; the only counties which exhibit an increase in the number of births being the Metropolitan and Extra-metropolitan parts of Surrey, Huntingdon, Staffordshire, and South Wales.

* The Table may be read thus, without reference to the decimal points:—In the year 1848, to 100000 of the population of England there were 798 marriages, 3249 births, 2307 deaths registered.—The annual rates of marriage in each of the 4 quarters were ·661, ·805, ·755, and ·961 per cent.; the rates of death 2·794, 2·313, 2·005, and 2·108 per cent. In reading the population on the first line add 3 ciphers (000). The 3 months January, February, March, contain 90, in leap year 91 days; the 3 months April, May, June, 91 days; each of the 2 last quarters of the year 92 days. For this inequality a correction has been made in the calculation.

INCREASE OF POPULATION.

The number of births registered during the last quarter being 144444, and the number of deaths 103341, there remains a balance of 41103 as the natural increase of the population during that period. Large numbers of persons are still attracted to the Australian Colonies, as well as to America and other places, although a small decrease in the emigration is perceptible on the numbers of the corresponding quarter of 1852. From the 4 English ports which make returns, 50457 persons emigrated during the last 3 months; namely, from London, 6810; Plymouth, 2851; Liverpool, 37732; and Southampton, 3064. In addition, 1795 persons sailed from the ports of Glasgow and Greenock, and 2431 from Irish ports, giving a total of 54683* for the United Kingdom, against 55315 during the last quarter of 1852. It must be borne in mind, in any estimate of the increase of population, that the births and deaths refer only to England and Wales, and that of the emigrants leaving English ports a large though an unascertained number are of Irish birth.

Prices of Provisions.

The chief articles of food have greatly risen in price since the three months ending December 1852; wheat, which was then 40s. 5d. per quarter, has risen to 69s. 10d., being an increase of 73 per cent.; and at this higher price an average weekly sale of 79002 quarters took place in the towns of England and Wales which make returns, against 111224 quarters weekly when the price was 40s. 5d. Beef and mutton rose in price; and potatoes, which were 105s. per ton at the waterside Market, Southwark, in December 1852, rose to 150s. in the December quarter, 1853, being an augmentation in price equivalent to 43 per cent. The continued activity of trade and the increased rate of wages has enabled the labouring classes for the most part to cope with the dearness of provisions; but, in conjunction with the severity of the weather and the exorbitant price of fuel, it has been a season of trial; which has, however, been borne with exemplary patience and fortitude by those who were most exposed to its rigours.

The AVERAGE PRICES of Consols, of Wheat, Meat, and Potatoes; also the AVERAGE QUANTITY of Wheat sold and imported weekly, in each of the Eight Quarters ending December 31st, 1853.

† Note.—The total number of quarters of wheat sold in England and Wales for the 13 weeks ending March 31st, 1852, was 1,241,921; for the 13 weeks ending June 30th, 1,143,339; for the 13 weeks ending Sept. 30th, 1,023,251; for the 13 weeks ending Dec. 31st, 1,445,906; for the 13 weeks ending March 31st, 1853, 1,236,493; for the 13 weeks ending June 30th, 1853, 1,099,261; for the 13 weeks ending Sept. 30th, 1853, 1,119,128; and for the 14 weeks ending Dec. 31st, 1853, 1,106,027. The total number of quarters entered for Home Consumption was respectively 358,024; 710,780; 882,850; 947,310; 825,886; 1,074,095; 1,560,255; and 1,191,149 (13 weeks).

* From a Return with which the Registrar General has been favoured by the Emigration Commissioners.

The fall of snow, the low temperature, and the other meteorological phenomena of the quarter, are fully and ably described by Mr. Glaisher (see pp. 58, 59).

STATE OF THE PUBLIC HEALTH.

There died last quarter in ENGLAND and WALES 103,341 persons. The period was unhealthy, and a greater number of lives was lost to the population than in any other autumnal quarter of the last 13 years, with only two exceptions,—the fourth quarter of 1846, when the deaths rose to 108,937; and that of 1847, when they were 103,479. The annual mortality has been at the rate of 2·252 per cent. in the 10 years 1843–52; it was 2·186 in the last quarters of those years; and last quarter it was 2·272. Cold weather towards the close of the year thinned the ranks both of old and young, and the latter class have also suffered much from fever, especially scarlatina, in many parts of the country.

LONDON makes a large contribution to this excess of mortality; for in the metropolitan division the deaths in October, November, and December rose to 16,390, which is more by 2,709 than took place in the same quarter of the previous year. In the last fourteen weeks of 1853, 17,390 persons died in London, and more than the usual proportion of these were carried off by zymotic diseases. (those of epidemic character), principally cholera, typhus, scarlatina, hooping-cough, and diarrhœa. Cholera and typhus killed almost equal numbers, viz. 728 and 724; scarlatina and hooping-cough were rival powers of destruction, for 668 and 667 are claimed as their respective shares; 565 deaths were caused by diarrhœa, besides 41 by dysentery. It is to be observed that these diseases, severally, not only produced more than the average number of deaths in this quarter, but showed a disposition to increase as the year drew to a close. In the summer months cholera was fatal in 137 cases, it rose to 728 in autumn; typhus (including continued fever, &c.) rose in the same periods from 585 to 724; scarlatina from 397 to 668; and hooping-cough from 426 to 667. Diarrhœa forms an exception, having declined from 1,232 in the summer to 565 in the autumnal quarter. Croup nearly doubled its comparatively small rate of mortality, and measles also became more fatal towards the end of 1853.

Whilst the young suffered from their peculiar diseases, the old had their own maladies to contend with. The number of deaths at all ages from diseases of the respiratory organs (exclusive of phthisis and hooping-cough) were, in the 14 weeks, 3,291. There died between 600 and 700 more than is usual in the same season. Bronchitis was fatal in 1,460 cases, pneumonia in 1,389, phthisis in 1914. 15 persons in London suffered death from cold, and the privation, from some cause, of necessities of life; 27 were the victims of their own intemperate habits. It is probable that want in some cases and vicious indulgence in spirits in many others produced disease, or carried it to a fatal issue, where the register does not reveal their operation.

In the last quarter large town populations were unhealthy, but, judging from the mortality, smaller towns and the inhabitants of the open country appear to have enjoyed as much health as usual. In 117 districts, comprising the chief towns, the rate of mortality *per annum* was 2·778 to 100 inhabitants; the annual mortality in 10 autumn quarters (1843–52) was 2·634. In 507 districts, consisting chiefly of small towns and country parishes, the mortality was 1·911; the average was 1·965. Country Registrars refer in their Reports to measles and other complaints prevailing among children;

in some instances these appeared in a mild form, and in others not mentioned they were probably much less destructive than in towns.

In the SOUTH EASTERN DIVISION (II.) the deaths registered were 7956, which scarcely differs from the number recorded in the same quarter of 1852, and affords a not unfavourable result. But the mortality in Kent (one of the counties in this Division) is high, scarlatina having been prevalent in Maidstone and Margate. Fever had also prevailed at Folkestone and at Brenchley. The Registrar of the latter place reports that "the number of deaths (29) exceeds the average by one fifth, in consequence chiefly of a severe epidemic of fever (of typhoid type), in which the proportion of fatal cases was about 1 in 8. The disease originated among the Irish poor, imported for the purpose of hop-picking, and was distinctly propagated by personal contagion." In Hampshire, both at Kingston (Portsea Island) and Southampton, small-pox had been prevalent, as well as fever to a great extent at the former.

The deaths registered in the SOUTH MIDLAND DIVISION (III.) were 6057, not so many as in most previous seasons. They were few in the counties of Hertford, Oxford, and Bedford. Both Peterborough and Daventry in Northamptonshire had suffered, the former from small-pox and scarlatina, the latter from typhus. In the sub-district of Soham in Cambridgeshire, the deaths, which had been 50 in the corresponding quarter of 1852, rose to 112 last quarter, in consequence of cholera in October and November, which was fatal to 61 persons. In the district of Ely, in the same county, a great deal of fever prevailed at Stretham, and 2 cases of cholera occurred at Haddenham, whilst in the parish of Sutton diarrhœa attacked the inmates of almost every house. The deaths were 61 in the sub-district of Ely, against 39 in the corresponding quarter of 1852, and 17 of those were caused by cholera.

Only 5106 deaths were registered in the EASTERN DIVISION (IV.) Diarrhœa was epidemic at West Ham in Essex, and cholera made its appearance, but without being fatal in any case. The district of Norwich lost many lives from small-pox. The Registrar of Coslany, which forms part of it, counts 10 deaths from this disease, besides 18 from fever, making nearly a third of the whole number registered; and he attributes the deplorable facts to defect of sanitary arrangements. In Conisford, another of its sub-districts, 15 deaths from small-pox occurred, and in West Wymer (Norwich) there were no fewer than 19. In not one of these 19 cases had the sufferers been previously vaccinated. The uneducated, says the Registrar, have a great dislike to such protection. Choleraic diarrhœa prevailed at Downham in Norfolk.

The returns are on the whole favourable for the SOUTH WESTERN DIVISION (V.), in which the deaths of the autumn quarters fell to 8498; but in parts of it, Chippenham (where typhus and scarlatina prevailed) and Exeter (where the Registrar of St. Sidwell states that health has suffered from the severity of the weather and the high price of fuel and "all sorts of provisions"), the mortality was rather high. Plymouth was attacked by cholera, and 44 persons died of it in November and December. It visited Stoke Damarel in the same county. Cornwall, in this division, has been unhealthy, and the deaths in it rose to 1899. Scarlatina raged in Falmouth district, and in its sub-district Constantine about 100 cases, 16 of which were fatal, occurred chiefly among the poor. The cottagers have dung-pits near their dwellings, from which, in the Registrar's opinion, the disease is fed. In the district of Redruth the average of deaths in the autumns of 1849-52 was 280, last quarter they were 419; scarlatina has been the largest contributor to so great an increase. Cholera was fatal to 32 persons; and diarrhœa, measles, and whooping-cough are also mentioned by the Registrar of the sub-district of Redruth, in which the mortality has been greatest.

The WEST MIDLAND DIVISION (VI.) has in some parts suffered severely; the deaths were 12612, or more than 800 above the average of corresponding quarters. Scarlatina, whose traces have been already seen in so many parts, committed great ravages in the counties of Stafford and Warwick. The Registrar of Fenton (Stoke-upon-Trent) states, that in the streets where the disease has been most prevalent, the houses are entirely without sewers, and the cellars are flooded with stagnant water to the depth of 6 to 12 inches. Wolverhampton did not escape; but on Sedgley (in Dudley) the plague apparently had discharged its fury. In this sub-district the deaths were 316; they were 123 above the average, and 149, or nearly a half of the whole number, were from a malignant description of scarlatina which prevailed in summer, and spread with renewed force during autumn. Birmingham suffered a sharp attack; it was common in Worcestershire, in Shrewsbury, and other parts of Shropshire. The mortality was heaviest in the following places: Wolverhampton, where the deaths were 860, or 103 above the average of corresponding quarters (1849-52); West Bromwich, where they were 540, or 100 above the average; Dudley, where they were 1032, or more than 300 above the average; and Birmingham, where they were 1444, exceeding the average to the same extent. In Kingswinford (Stourbridge) there were 3 deaths from cholera, and in Leigh (Martley) one.

The deaths rose to 6541 in the NORTH MIDLAND DIVISION (VII.). Three of the five counties of which it consists, Lincoln, Nottingham, Derby, were swept by scarlatina. The districts of Boston, Grantham, Lincoln, Horncastle, suffered much; also Worksop, Radford, Nottingham, Southwell. The mortality from the disease was high in Derby, Ashborne, Chesterfield, Bakewell, Chapel-en-le-

Frith, and Hayfield. Speaking of the homes of 1000 persons in Chesterfield and its neighbourhood, the Registrar says, "The sanitary condition of the Irish labourers is deplorable." Cholera was fatal to 9 lives at Holbeach. Small-pox prevailed at Nottingham and Ashborne.

In the NORTH WESTERN DIVISION (VIII.) the deaths rose to 17851. It consists of Cheshire and Lancashire, both of which were overrun by the epidemic so fatal to the young. Stockport had an attack of the most violent kind, and the Registrar of Heaton Norris, one of its sub-districts, states that the disease created almost as much alarm as cholera. Here, in consequence of the "turn-out" and dearth of food, families were ill prepared for such a visit. Congleton, Wigan, Bury, Chorlton, Ashton-under-Lyne, Oldham, Rochdale, and Ulverstone suffered. Half of the total deaths in Ulverstone *sub-district* were from scarlatina. 20 deaths (out of 116) from small-pox were registered in the *sub-district* of Congleton. 163 deaths from cholera are reported in Liverpool; a few also in West Derby; one at Wigan. A decrease in births at Wigan and Preston is attributed to strikes causing a movement of families from those places. The deaths were 864 in the district of Stockport, or 342 above the average. They were 223 in that of Congleton, or 57 above the average. In the districts of Liverpool, Wigan, and Chorlton, the deaths rose to 2270, 692, and 1005. Manchester registered 2148, also a high mortality. In Preston 676 were registered, 73 above the average.

The YORK DIVISION (IX.) in which 10676 deaths occurred, furnishes more favourable returns, except for some of the large towns, Bradford, Sheffield, York, &c., where the mortality was great. Scarlatina, aided by cold, wet and changeable weather, pervaded these and other parts in all the Ridings. At Doncaster, which suffered from it, the mortality was high. Leeds and Hull were more fortunate. A German emigrant died at the latter place from cholera; a woman died of it in Bradford; a tailor of the same disease at Barnsley. The linen trade was depressed at Barnsley, the coal trade in great activity. Fancy manufacture had improved at High Hoyland.

The 5770 deaths in the NORTHERN DIVISION (X.) are not few, but they show a decrease on those of the summer quarter. Cholera was diffused here to a wide extent. Fatal cases of it in the December quarter are reported as follows: 13 at Stockton, 10 at Bishop Auckland, 6 in Saint Nicholas, Durham, 3 or 4 at Easington, 7 at Hetton-le-Hole, one at Chester-le-Street, 18 in Sunderland, 15 in Westoe (South Shields), 94 at Gateshead, 124 in Tynemouth, one at Allendale (Hexham), 13 at Bedlington (Morpeth), 44 in Cockermouth. It continued to raise the mortality in Newcastle. Scarlatina was severe at Whitehaven on the west coast, and in Alnwick on the east. It prevailed along the coast of the latter district, but spared the parts remote from the sea. It was also fatal at Kirkby Lonsdale in Westmoreland.

In the WELSH DIVISION (XI.) the deaths, 5884, were a little above the average. Scarlatina visited Cardigan, Wrexham, Ruthin, and Corwen with severity. At Cowbridge 40 families have been attacked by typhus, which originated at a ball, where the guests supped over a stable, and on premises which were in a filthy state from want of drainage.

Mr. Leigh, Registrar of Deansgate, a sub-district of Manchester, has made some useful observations on the public health of that locality, and the propagation of those diseases which have produced so great a mortality, in a letter addressed to the Registrar-General, which will be found at page 46.

MARRIAGES Registered in the Quarters ending September 30th, 1849-53; BIRTHS and DEATHS Registered in the Quarters ending December 31st, 1849-53, in the DIVISIONS, COUNTIES, and DISTRICTS of ENGLAND.

* The Registration Counties consist of groups of entire Registration Districts; which Districts are, in general, identical with the Poor Law Unions. As the principle has been adopted of placing a District or Union which extends into more than one County with the County in which either the principal town or the greater part of the population is located, the limits of the Registration Counties, differ more or less from the boundaries of the Counties proper.

On the Meteorology of England and Scotland, during the Quarter ending December 31st, 1853. By
JAMES GLAISHER, ESQ., F.R.S., Sec. of the British Meteorological Society.

The temperature, till 20th October, was 1·8° below its average, in the period from 21st October to 8th November it was 5·3° above, and from 9th November to the end of the year it was 4·8° below the average. The temperature of December was 7° below the average of the 12 preceding Decembers. During the period from 9th November there were several instances of very low temperatures; on some days the mean for the day was 10°, 11°, 12°, and in one case 13° below the respective averages. With the exception of the interval between 21st October and 8th November the weather has been cold throughout the quarter.

The maximum cold for the season, in the whole country, took place during the night common to December 28th and 29th. This cold extended from the most southern to the most northern station.

The reading of the barometer was low in October; it was very high in November. The excess of reading in November over that in October was nearly four-tenths of an inch at all places; it decreased by December in England, but still farther increased in Scotland.

The fall of rain was one-third above its average in October, and fell short of the average in November and December, except in Cornwall and Devonshire. The general deficiency for the quarter is about one inch.

Snow fell at a few places north of the parallel of 53° on 17th November; at places north of 51° on 24th November; and at the Islands of Jersey and Guernsey at the end of the year. It fell generally over England after the middle of December.

The direction of the wind has generally been a compound of the north or east, except in the interval from 21st October to 8th November, when it was mostly south-west.

The air has been drier than usual, particularly in December, in which month the difference of air and dew-point temperature, notwithstanding the low value of the former, was greater than usual, consequently the degree of humidity was low.

Fog was very prevalent in October and November, particularly between the parallels of latitude of 51° and 52°. In November it was more or less prevalent on 28 days, and on some days extended all over the country. At times it was very dense within a band extending across the country between the above parallels of latitude. In December fog was most prevalent below the parallel of 53° and 54°.

The mean temperature of the air at Greenwich for the quarter ending November, constituting the 3 autumn months, was 49°·4, being 0°·1 above the average of 80 years.

NOTE.—In reading this table it will be borne in mind that the sign (–) minus signifies below the average, and that the sign (+) plus signifies above the average.

Thunderstorms occurred, or thunder was heard and lightning seen, on the 8th October at Greenwich, Paddington, Stone, Hartwell House, Hartwell Rectory, and Aylesbury; and on the 27th at Lewisham, Greenwich, Paddington, and Thwaite, Suffolk. On the 5th November at Guernsey; and on the 26th at Guernsey and Truro. On the 27th December at Liverpool; and on the 28th at Durham, Newcastle, and North Shields.

Thunder was heard, but *lightning* was not seen, on the 1st October at Warrington; on the 8th at Truro, Lewisham, and Stone; on the 9th at Guernsey; on the 12th at Ryde; on the 22d at Arbroath; on the 25th at the Isle of Man; and on the 26th and 27th at Stonyhurst. On the 30th December at Royston.

Lightning was seen, but *thunder* was not heard, on the 1st October at Oxford and Norwich; on the 2d at Oxford, Stone, Hartwell Rectory, Aylesbury, Nottingham, and Durham; on the 21st at Arbroath; on the 26th at Jersey, Guernsey, Stone, Hartwell Rectory, and Norwich; on the 27th at Jersey, Guernsey, Exeter, Rose Hill, Oxford, Stone, Hartwell Rectory, Aylesbury, Linslade, Cardington, Norwich, Warrington, and the Isle of Man; and on the 28th at Warrington. On the 5th November at Greenwich, Oxford, Stone, and Hartwell Rectory; on the 8th at Arbroath; on the 20th at Dunino; on the 25th at Truro; and on the 26th at Exeter. On the 28th December at Stonyhurst.

Hail fell on the 1st October at Liverpool; on the 2d at Jersey, Linslade, and Hawarden; on the 3d at the Isle of Man; on the 8th at Hartwell Rectory; on the 13th at Stone; on the 16th at Liverpool and Whitehaven; on the 21st and 23d at Durham; and on the 26th at Nottingham. On the 16th November at Truro; on the 24th at Bicester and Dunino; on the 25th at Dunino; and on the 26th at Guernsey. On the 10th December at Helston; on the 11th at Truro; on the 15th at Guernsey, Truro, Holkham, North Shields, and Dunino; on the 16th at Guernsey, North Shields, and Dunino; on the 19th at Torquay and Dunino; on the 20th at Dunino; on the 21st at Guernsey, North Shields, and Dunino; on the 22d at Guernsey; on the 23d at Guernsey and North Shields; on the 24th at Guernsey; on the 25th at Guernsey and Whitehaven; on the 27th at Helston, Falmouth, and Truro; on the 28th at Helston, Truro, North Shields, and Dunino; on the 30th at Exeter and Isle of Man; and on the 31st at Falmouth, Exeter, and Oxford.

Snow fell on the 17th November at Hawarden and North Shields. It fell generally at places north of latitude 57° on the 24th. After the 15th December it fell nearly at every station, and on the 27th, 28th, and 29th, at Jersey and Guernsey. The fall on the 15th December was in many places as deep as 6 inches.

Fog was prevalent on 20 days in October, and principally confined to the space between the latitudes of 51° and 52° ; occasionally it extended to the Isle of Wight, and as far north as Lancashire. In November it was present on every day, with the exception of the 5th and 29th. It was most frequent and most dense between the parallels of 51° and 52° , and at times it was more dense than it has been for many years. In the returns from Jersey, Guernsey, and the counties of Cornwall and Devonshire, no mention of fog was made. With these exceptions the fog was mentioned in every place from the Isle of Wight to Arbroath. In December fog was prevalent on 20 days, but was most frequent between the latitudes of 53° and 54° ; at some places in the south it was only noticed on 3 or 4 days.

Auroræ were seen on the 17th October at Durham; on the 23d at Dunino; on the 25th at Nottingham, Durham, Dunino, and Arbroath; on the 29th at Whitehaven; on the 30th at Dunino; and on the 31st at Clifton, Lewisham, Greenwich, Cardington, Norwich, Grantham, and Nottingham. On the 1st November at Oxford; on the 2d at Whitehaven; on the 8th at the Isle of Man, Durham, North Shields, Dunino, and Arbroath; on the 9th at Nottingham; on the 11th at Dunino; on the 21st at North Shields; and on the 22d at Stone, Stonyhurst, Isle of Man, and Durham. On the 5th December at Helston and Nottingham; on the 6th at Truro, Clifton, Lewisham, Greenwich, Stonyhurst, Isle of Man, Whitehaven, Durham, North Shields, Dunino, and Arbroath; on the 8th at Durham; on the 23d at Greenwich; on the 24th at Clifton; on the 26th and 27th at Falmouth; on the 28th at Warrington; on the 29th at Jersey and Clifton; and on the 30th at Jersey.

Lunar Halos were seen on 20 days throughout the quarter.

Solar Halos were seen on the 15th October at Stone, and Hartwell Rectory; on the 24th at Nottingham; and on the 27th at Grantham. On the 8th November at Greenwich, Stone, Hartwell Rectory, Grantham, and Nottingham; on the 9th at Nottingham; on the 10th at Stone and Hartwell Rectory; on the 11th at Greenwich and Aylesbury; on the 12th at Nottingham; on the 14th at Dunino; on the 18th at Clifton and Hawarden; and on the 20th and 27th at Clifton. On the 2d December at Stonyhurst, Durham, and North Shields; on the 7th at Stonyhurst; on the 13th at Dunino; on the 17th at Hawarden; on the 18th at Grantham and Nottingham; on the 19th at Nottingham; and on the 29th at Grantham; and on the 31st at Stone and Hartwell Rectory.

Harvest was completed on the 1st November at Gainsborough; on the 2d at Hartwell Rectory and Linslade; on the 5th at Hawarden; and on the 10th at Nottingham.

The mean of the numbers in the first column is 29°653 inches, and it represents that portion of the reading of the barometer due to the pressure of air; the remaining portion, or that due to the pressure of water, is 0°261 inch; the sum of these two numbers is 29°914 inches, and it represents the mean reading of the barometer for the quarter at the level of the sea.

The highest readings of the thermometer in air were 70°0 at Jersey, 68°9 at Lewisham, and 68°0 at Helston, Falmouth, Aylesbury and Derby. The lowest were 6°0 at Linslade, 9°5 at Wakefield, 10°2 at Warrington, 10°4 at Grantham, 10°5 at Aylesbury and Gainsborough, and 10°7 at Clifton, Bristol. The least daily ranges of temperature took place at Guernsey, Liverpool, Whitehaven, Durham, North Shields, Torquay, Ventnor, and Hawarden; and the greatest at Midhurst, Helston, Bicester, Lewisham, Nottingham, Wakefield, Bowdon, Exeter, and Aylesbury.

Rain fell on the least number of days at Ryde, Rose Hill, St. John's Wood, Aylesbury, Liverpool, and Jersey; and on the greatest number at Truro, Wakefield, North Shields, Grantham, Whitehaven, Falmouth, Warrington, Greenwich, Derby, and Stonyhurst. The least falls took place at Bedford, Liverpool, Bicester, Oxford, Derby, Stone, Hartwell Rectory, and Gainsborough; and the mean amount at these places is 5°3 inches. The largest falls occurred at Falmouth, Truro, Helston, Dunino, Whitehaven, Torquay, Durham, and Newport, and their mean is 11°5 inches.

QUARTERLY METEOROLOGICAL TABLE for different PARALLELS of LATITUDE.

PARALLELS OF LATITUDE, &c.	WIND.										RAIN.											
	General Direction.										Mean Amount of Cloud.		Number of Days.		Average fall.		Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.	Mean Height above the Sea level.
	Mean Temperature of the Air.	Mean of Highest Readings of the Thermometer.	Mean of Lowest Readings of the Thermometer.	Average Daily Range of Temperature.	Average Monthly Range of Temperature.	Average Quarterly Range of Temperature.	Mean Temperature of Evaporation.	Mean Temperature of the Dew Point.	Mean Amount of Cloud.	Average Number of Days.	Average fall.	Mean Weight of Vapour in a cubic foot of Air.	Mean additional Weight required to saturate a cubic foot of Air.	Mean degree of Humidity.	Mean whole Amount of Water in a vertical column of Atmosphere.	Mean Weight of a cubic foot of Air.	Mean Height above the Sea level.

Helston:—The range of the barometer readings in October is too small, and in November it is too large. Exeter:—The lowest reading of the barometer in November has been altered conjecturally from 29.23 in. to 29.63 in., and even then seems to be too low. All readings have been reduced by 0.1 for index error; the results are not satisfactory. Ventnor:—Rain in October fell on 15 days and 7 nights, in November on 5 days and 4 nights, and in December on 5 days and 7 nights. Worthing:—December, the reading of the maximum thermometer on the 1st was altered from 45° 5 to 55° 5.

Year 1853.	Month.	Mean Pressure of		Temperature of the Air.				Mean Tem- perature of		Wind.	Mean Amount of Cloud.	Rain. Number of Days it fell.	Amount col- lected. [illegible]

Enfield.—The barometer readings are discordant. The instrument is not good. The mean readings of the last 20 days only. Highfield House.—The readings of the barometer are all too high by 1 inch nearly; no further use has been made of them. Alderley Edge.—November. The reading of the barometer on the 7th, at 7h. 30m. A.M. was altered from 29.648 to 29.948, and on the 23d from 29.000 to 30.000. Bowdon.—24th November, at 7h. 30m. A.M., the reading of the barometer has been altered from 29.192 in. to 29.692, and on 29th December from 29.620 to 30.150. Leeds.—3d and 4th November, at 9h. A.M. The readings of the barometer have been altered from 29.090 and 29.030 to 30.090 and 30.030 respectively, and on the 5th the reading of the maximum thermometer has been increased from 50.0 to 60.0. Stonyhurst.—24th December, at 9h. A.M. The reading of the barometer has been altered from 29.500 to 29.900. York.—The reading of the wet bulb thermometer in October seems to be too high by something more than one degree, causing the dew point to be too high by 3°, and the degree of humidity throughout the quarter as too great. Durham.—The monthly falls of rain seem to be misplaced. **NOTE.**—Second rain gauges are placed: At Newport, at the height of 3 feet; the amount collected was 9.6 inches. At Clifton, 50 feet; the amount was 6.6 inches. At Oxford, 22 feet; the amount was 5.6 inches. At Holkham, 4 feet; the amount was 5.1 inches. At Warrington, 32 feet; the amount was 5.5 inches. And at Whitehaven, 78 feet; the amount was 5.3 inches.

A TABLE OF THE DEATHS IN LONDON FROM ALL CAUSES,

Registered in the December Quarters of the 5 Years 1849 to 1853.

* Under the head of sudden deaths are classed not only deaths described as sudden, of which the cause has not been ascertained or stated; but also all deaths returned by the coroner in vague terms, such as "found dead," "natural causes," &c. &c.

† The Weekly Returns of Births and Deaths in London for 1853 extend over a period of 53 weeks. The last 14 weeks, ending December 31st, constitute the December quarter in the above Table. An additional week was inserted in 1853 for the adjustment of the dates. At page 55, the December quarter comprises the 92 days of October, November, and December, and in that period 16390 deaths were registered.

LETTER to the REGISTRAR GENERAL on the CAUSES of DEATH in ENGLAND,
by WILLIAM FARR, Esq., M.D., F.R.S.

SIR,

23d February 1856.

THE public health in the year 1853 underwent some changes which can be only discovered by the causes of death; for the aggregate mortality differed little from the general average.

The temperature of the year at Greenwich was $47^{\circ}7'$, so it was $1^{\circ}7'$ below the average of 12 recent years. The defect of temperature became greater as the year advanced, and the mean temperature of the last three months ($42^{\circ}3'$) was $2^{\circ}7'$ below the average. The rain fall was 29 inches, or nearly *two* inches above the average. The dew point ($41^{\circ}7'$) was low, and the atmosphere was less humid than it is usually. Upon looking over the tables, the increase in the diseases of the respiratory organs is remarkable; and thus is seen again on a large scale the connexion between these diseases and a low temperature of the air.

Cholera was epidemic on the continent, and it was deemed right to give some warning of its approach in the first quarterly report, which appeared in April. "The outbreaks of cholera in Russia" it was observed, "demand the attention of the people of England, and should accelerate all the arrangements for the supply of pure water, the drainage of towns, and the removal of nuisances."

The epidemic broke out in London in August; and as the evils at which the above warning was directed were found extraordinarily rife in Newcastle-upon-Tyne, the epidemic raged with extraordinary violence in that town.* In London the mortality was as usual low for some time after the first appearance of the epidemic, and did not prevail with great intensity until the next summer. In the Report on the diseases of 1854, I hope to be able to give some account of the eruption of this great epidemic, which began in 1853 and attained its acme in the next year. Upon referring to the tables, it will be observed, that the total deaths from cholera in 1853 were 4419, of which 1927 occurred in Newcastle-upon-Tyne and in Gateshead.

421,097 deaths were registered in the year 1853, and the causes were specified in 414,198 instances, leaving 6899 deaths in which no cause sufficiently explicit to admit of classification was returned; and 4018 in which inquests were generally held, could only be classed under the head of "sudden deaths," as no information was given respecting the nature or the seat of disease. All the other causes may be briefly discussed under five great heads.

ZYMOTIC DISEASES.

The deaths from these diseases were 85,600 in number, or 21 per cent. of the total number.

Scarlatina, hooping-cough, diarrhœa, and typhus (including all the forms of continued fever) were the most fatal diseases of the class. The number of deaths from each of these causes ranged from hooping-cough 11,200, to typhus 18,013. Of small-pox 3151 persons died, of measles 4895, of croup 3660, of thrush 1202, of influenza 1789, of dysentery 1891. The deaths from cholera during the four years ending in 1853 were 886, 1132, 1381, and 4419.

* See the able Report of Mr. Simon and Mr. Hume.

CONSTITUTIONAL OR SPECIFIC DISEASES.

The deaths from these causes were 22 per cent. of the total deaths, or 90,998, and among them are 5663 deaths by cancer. The 10,302 deaths by dropsy include many cases in which the dropsy was an incident of heart disease, or of derangement of the kidneys.

TABLE (1)—CAUSES OF DEATH registered in ENGLAND in each of the Years 1850, 1851, 1852, and 1853.

43 Disease of Brain, &c. - -	2,970	3,101	3,507	3,444					

Consumption is more fatal than any other single disease in England, and 54,918 deaths are referred to that head. The deaths from this cause were 46,614 in 1850, and have since that year increased progressively without any very evident reason. The 8005 deaths from hydrocephalus are not all the consequences of tubercular affections, but are in many instances simply cases of effusion on the brain after inflammation. It is difficult, however, without autopsies to distinguish the two forms of disease.

TABLE (2)—ENGLAND. CAUSES OF DEATH. To 1,000,000 PERSONS LIVING, the DEATHS from each Class of Causes, and from each Cause, in the Years 1851, 1852, and 1853.

The Table may be read thus: In 1853 to every 1,000,000 Persons living there were 22,882 deaths from All Causes (nearly 23 in 1000); 174 deaths from small-pox; 270 from measles; 867 from scarlatina, and so on.

The evident inflammations of the brain in children are placed with cephalitis in the next class.

LOCAL OR MONORGANIC DISEASES.

Under this head are placed the inflammations and other local diseases of the eight systems of organs. The deaths are 156,724, of which 52,016 were the consequence of diseases of the nervous system, 56,436 of diseases

TABLE (3).—ENGLAND. CAUSES OF DEATH. To every 1,000,000 Deaths from All Causes, the proportional Numbers from each Class of Causes, and from each Cause, in the Years 1851, 1852, and 1853.

42 Convulsions - - - -		63,271	61,328	59,865					
43 Disease of Brain, &c. - - -		7,978	8,758	8,315					

The Table may be read thus:—To 1,000,000 deaths from All Causes in 1853 there were 7,607 deaths from small-pox; 11,818 from measles; 37,902 from scarlatina, and so on. By placing a decimal point before the three figures on the right hand, the proportion will be shown to 1,000 deaths; thus, there were 7.607 deaths from small-pox to every 1,000 deaths from All Causes.

of the respiratory system, and 48,272 of diseases of the other organs of the body. Of 100 deaths from all causes 38 are the results of these local diseases, 12·6 of the diseases of the nervous system, 13·6 of the diseases of the respiratory organs. If the deaths from consumption be added, the 13·6 become 26·9. Convulsions are the most fatal disease of the class, yet they are often mere dynamic states of the brain, nerves and muscular system, and not the result of any visible well-defined change of structure which the anatomist can perceive. Infants and very young children die of convulsions; and 10,819 girls, 13,973 boys, died of this disease. Epilepsy, which supervenes after puberty, was fatal to 2120 persons, 1158 males and 962 females. Chorea, a singular convulsive disease, is returned as the cause of death to 67 persons, 40 females and only 27 males. Insanity is often complicated with other diseases which are registered as the causes of death without reference to the mental disease. Of the 476 persons whose deaths are referred to insanity, 267 are females. Delirium tremens, one of the results generally of slow poisoning by alcohol, was fatal to 430 men and to only 79 women. Tetanus or lock-jaw supervenes on wounds, which are incidental to more men than women; hence 82 men and 34 women died of tetanus. Apoplexy and paralysis complicate each other, and are nearly equally fatal; thus, 8496 persons died of apoplexy and 8378 of paralysis, generally at advanced ages, the deaths of males preponderating in apoplexy, of females in paralysis. Such are the maladies of that wonderful system of organs which especially distinguish man from the inferior animals; some at the various stages of life paralyzing him, some deranging his powers of motion, and others assailing his passions or his intellect.

The *heart and blood vessels* failed in 13,740 instances, 315 deaths having been set down to aneurism, 561 to pericarditis, and 12,864 to other diseases of the heart or of the vessels. Aneurism to 83 females, killed 232 males; the other diseases of this central system affected both sexes almost equally. To this class belong many of the deaths under dropsy; it increases as the diagnostic power of the medical profession increases.

Among the diseases of the respiratory organs bronchitis and pneumonia were exceedingly prevalent, and were nearly equally fatal in the year 1853. In 1850 and 1853 bronchitis was fatal to 14,612 and 22,391 persons respectively, pneumonia to 20,303 and 24,098. Asthma also increased, and was the direct cause of 5143 deaths. Laryngitis, pneumonia, pleurisy, and asthma were much more fatal to males than to females; bronchitis also destroyed 11,587 males to 10,804 females. The deaths of males from all diseases of the respiratory organs were 30,764, of females 25,672; of consumption, one of the tubercular diseases, however, 25,955 males and 28,963 females died.

The *diseases of the digestive organs* were fatal to nearly an equal number of males (11,934) and females (11,926). Teething was fatal to 4678 children, enteritis, peritonitis, ulceration of intestines, and ileus are the chief diseases of the intestinal canal; 9 deaths are referred to the pancreas, 6898 to the liver, 64 to the spleen, 12,211 to the intestinal canal. Teething, enteritis, hernia, intussusception, and liver disease were more fatal to males than to females; while from gastritis, peritonitis, ascites, ulceration and stricture of the intestinal tube, and from spleen disease women were the greatest sufferers.

The deaths from the diseases of the remaining systems were not numerous. 3893 persons died of *diseases of the urinary organs*, 3343 of *diseases of the organs of generation*, 2670 of *diseases of the bones and muscles*, and 766 of *diseases of the integumentary system*. Stone, stricture, and all the diseases of the urinary organs, are much more fatal to men than to women; upon the other hand 3331 of the 3343 deaths in the class of diseases of the

organs of reproduction, including childbirth, befel women ; 3063 women died in childbirth or of its incidental diseases, including 795 by metria or puerperal fever. To every 200 *children* born alive *one* mother died.

Of carbuncle and boil 252 persons died, and the numbers, it will be observed, have increased since 1850 ; but the deaths under phlegmon have declined to nearly an equal extent.

DISEASES OF GROWTH, NUTRITION, AND DECAY.

The deaths by diseases of this group are 62,046, including the deaths of 18,968 children frail and often prematurely born, 865 deaths resulting from malformations, and 13,072 deaths from atrophy and wastings away without any evident organic disease. By old age 29,141 persons died, namely, 12,598 old men, and 16,543 old women. Malformation and premature births were fatal to more males than females.

VIOLENT DEATHS, OR DEATHS FROM EVIDENT EXTERNAL CAUSES.

14,812 deaths of this class are recorded in the year. 373 deaths were the direct effects of intemperance, exclusive of 509 deaths by delirium tremens and other diseases which should properly be referred to this head ; 78 deaths are referred to the want of food, 103 to cold, 21 to neglect, and 632 to the want of breast milk, the natural food of infants.

By poison 409 persons died, by burns and scalds 2590, by hanging and suffocation 1249, by drowning 2508, by wounds 574, by fractures and contusions 5551, and by other violence 724.

Deaths by poison were less numerous in the two years 1852-3 (779) than in the two previous years (1850-1) 899.

The deaths by violence to every 10,000 *living* were 8, and 36 in every 1000 *deaths* were by violence. These deaths are on the increase in England.

Violent deaths in the aggregate killed 10,725 males and 4087 females. Burns and scalds alone are more fatal to females (1377) than to males (1213).

I beg to submit to you an improved scheme of the statistical nosology, with two papers which I have drawn up on subjects which were under consideration at the Statistical Congress of Paris.

I have the honour to be,

Sir,

Your obedient and humble Servant,

WILLIAM FARR.

REPORT

ON THE

NOMENCLATURE and STATISTICAL CLASSIFICATION of DISEASES, for STATISTICAL RETURNS.

1856, Feb. 15.

THE first Statistical Congress in Brussels passed a resolution to the effect that it is desirable to construct a uniform nomenclature of the Causes of Death, applicable in all countries. Dr. d'Espine and I were requested to prepare a Report on the subject for the Second Congress in Paris. After some correspondence with Dr. d'Espine, I carefully revised the Statistical Nosology which has been in use in England since 1838: and further relying upon the willingness of the members of the medical profession in the United Kingdom to co-operate in carrying out such an important national object as that to which attention had been directed by the Statistical Congress, the NOSOLOGY in its first form was submitted, with the approbation of the Registrar General, to a certain number of English, Scotch, and Irish physicians and surgeons whose attention has in various ways been directed to the study and classification of diseases. Several of them favoured me with valuable notes and suggestions, of which I have availed myself in the present arrangement.

These distinguished men must not, however, be held in any way responsible for defects either in the plan or in the execution of the work.

WILLIAM FARR.

ON THE

NOMENCLATURE and STATISTICAL CLASSIFICATION of DISEASES.

PERIODICAL Returns of the fatal diseases and injuries of the population have been published in London since the commencement of the seventeenth century; in the Department of the Seine, since 1809; and in some States the national registers contain a column in which the cause of death is inscribed. Since 1837 the causes of death have been classified and have been published in England in conformity with the principles of a statistical nosology which is there in use; and at the Census of 1851 the diseases and infirmities of the population of Ireland were returned and classed in the same order as the deaths.

The progress of the natural sciences is greatly promoted, as experience has shown, by the adoption of a nomenclature which can be used in every country, and which leaves but little doubt that the same thing is designated by the same or by strictly synonymous words. The utility of a uniform nomenclature in the registration of the causes of death was so strongly felt at the first Statistical Congress, that the members expressed their opinion in the subjoined resolution; and Dr. Marc d'Espine and I were requested to prepare a Report on the ground that we had for several years the practical direction of statistical inquiries on this subject in Geneva and in England.

The resolution is to this effect:—

“ *Il y a lieu de former une nomenclature uniforme des causes de décès applicable à tous les pays.* Cette nomenclature, dont l'importance ne peut être méconnue, fera l'objet d'études ultérieures, et pourra être arrêtée dans un prochain congrès.” Bulletin,
p.116.

Objects of the Record and Tabulation of the Diseases of Mankind.

The state of health among the people differs in different times and in different places; and the principal purpose of the registration of diseases is to determine the degree of their variation in each district, and in each class of the population, as well as the extent to which they are modified by circumstances.

The causes of insalubrity are thus discovered at their source by death itself; and it is found that in many instances these causes admit of removal by sanitary measures.

The deaths that are the direct result in any way of human agency undergo judicial investigation, which is often aided by the purely statistical inquiry.

The difficulties that attend the inquiry into the diseases of a whole population are numerous. They may be referred to several heads. The phenomena are sometimes exceedingly complicated, and those of the greatest importance pass within the human body. Medical science is, notwithstanding all its achievements, still imperfect; the medical observers all over the country are not always familiar with the latest improvements in the practice of their art, and it often happens that they are only called to see their patients in the last days of illness. In parts of our towns, as

well as in remote parishes of the country, many young children and old people die without being seen by any medical man.

No perfect record of the diseases of mankind can, therefore, we believe, be obtained in the present state of civilization; but experience justifies us in saying that the record of the ascertained facts, and of the opinions of the existing race of medical practitioners in Europe, is of value, and admits of many practical applications.

Persons by whom the Cause of Death should be certified.

(See Form of
Certificate.)

The medical man who attends the sick in illness should be called upon in the case of death to give a *certificate* stating the diseases of which the patients died, the duration of disease (when known), and the date of the last visit.

Where any person dies who has not been attended by a qualified medical man, the body should be inspected, and the certificate filled up, when practicable, by a district health officer, or by some specially-appointed medical man.

The plan that is pursued in Geneva, in Brussels, in Paris, and in other cities, of appointing a medical officer to visit everybody, and to report independently on the *cause of death* to an appointed health officer, who has thus the opportunity of comparing the certificates from two sources, is calculated to insure accuracy, and deserves to be adopted in towns. But in the country districts *economy of skilled labour* is indispensable. If there the sick poor, while alive, are inadequately supplied with medical advice and medicines, it is vain to expect that two skilled officers can be specially employed to find out the causes of death.

The public registers should embody in simple terms the last results of judicial or other investigations into the causes of death.

Nomenclature for Registers.

Notwithstanding the differences of doctrine, there is now a general agreement all over Europe in the designation of diseases, and popular terms can in many instances be employed without risk of inaccuracy.

In each country—that the public register might be intelligible to the people—the common names should be used where they briefly and distinctly designate a disease, except in cases where the vulgar name may be offensive. It is, however, desirable for statistical purposes that the *names* of diseases should be devoid of all ambiguity, and, to facilitate the abstracts, that they should be *single*. Such double names as are used in botany and the other sciences of natural objects would be cumbersome, and are not required.

In the national register we recommend the use of the popular names; substituting for them, however, the ordinary technical name whenever it is necessary for the sake of accuracy or of brevity.

In popular and judicial nomenclature names have been employed expressive of imperfect knowledge of the causes of death, and some of these names must be adopted. Thus, a person dies suddenly at home, and the cause is not discovered; or a man is found dead from home, without evident injury; such cases are returned under “sudden death,” or simply “found dead,” with the addition of any important circumstance.

A class of names in universal use, such as “dropsy,” and frequently occurring in the mortuary registers, is looked upon with little favour by pathologists; some of whom have proposed that such names shall be altogether discarded. And it is undoubtedly true that many cases of dropsy, convulsion, paralysis, and other forms of disease are every day

traced to organic lesion of the heart, kidney, brain, or other organ ; but can this be done in all cases with all the assistance derived from the autopsy? Can the lesion on which those diseases depend be discovered with certainty where the medical man sees the patient only for a short time under unfavourable circumstances?

The permission to use vague terms in these cases, it is objected, encourages negligence ; but the refusal to recognize those terms that express imperfect knowledge has an obvious tendency to encourage reckless conjecture. It appears, therefore, to be a safer course to retain, for the present, terms of this kind, and at the same time to urge observers to refer specifically to the primary organic lesion wherever it can be satisfactorily determined.

Certain deaths occur in birth, in teething, in puberty, in child-bearing, in the climacteric ages, in old age, which can be referred to no definite disease—to no circumstance except the peculiarities of the condition of the organization at those periods ; names designating these conditions must, therefore, be recognized.

Nomenclature for Mortuary Tables.

LATIN NAMES might be used in the *National Tables* of the causes of death, which would then be designated in a way everywhere intelligible among scientific men ; but the same object will be attained by using strictly synonymous terms in the national idioms. A list of these names in the Latin, English, French, and German languages is appended.*

The names which designate FATAL DISEASES of COMMON OCCURRENCE, and which should appear in all the tables, are printed in the Nosology in small capitals.

Nomenclature of Diseases and Injuries that produce Sickness or Disability.

It is evidently desirable to extend the same system of nomenclature to diseases which, though not fatal, cause disability in the population, and now figure in the tables of the diseases of armies, navies, hospitals, prisons, lunatic asylums, public institutions of every kind, and sickness societies, as well as in the census of countries like Ireland, where the diseases of all the people are enumerated.

I have therefore included in the general list the greater part of those diseases, such as ulcers, itch, blindness and infirmities of various kinds, to serve for the classification of the diseases that affect the health, as well as of diseases that are fatal.

These diseases, as well as the diseases that are not prevalent in Europe, are omitted in the Mortuary List.

NOSOLOGY : CLASSIFICATION OF DISEASES AND CAUSES OF DEATH.

The causes of death were tabulated in the early Bills of Mortality (*Tables mortuaires*) alphabetically ; and this course has the advantage of not raising any of those nice questions in which it is vain to expect physicians and statisticians to agree unanimously. But statistics is eminently a science of classification ; and it is evident, on glancing at the subject cursorily, that any classification that brings together in groups diseases that have considerable affinity, or that are liable to be confounded with each other, is likely to facilitate the deduction of general principles.

* I have been supplied with the Italian names by a learned colleague at the congress, Signor Bertini, and with the Swedish names by Dr. de Berg one of the vice presidents. I postpone the publication of these names until I obtain the Spanish and Russian names.

Classification is a method of generalization. Several classifications may, therefore, be used with advantage; and the physician, the pathologist, or the jurist, each from his own point of view, may legitimately classify the diseases and the causes of death in the way that he thinks best adapted to facilitate his inquiries, and to yield general results.

The medical practitioner may found his main divisions of diseases on their treatment as medical or surgical; the pathologist, on the nature of the morbid action or product; the anatomist, or the physiologist on the tissues and organs involved; the medical jurist, on the *suddenness* or the *slowness* of the death; and all these points well deserve attention in a statistical classification.

In the eyes of national statisticians the most important elements are, however, brought into account in the ancient subdivision of diseases into plagues, or epidemics and endemics—into diseases of common occurrence (sporadic diseases), which may be conveniently divided into three classes, and into *injuries* the immediate results of violence or of external causes.

CLASS I.—EPIDEMIC, ENDEMIC, AND CONTAGIOUS DISEASES.—

Zymotici [Morbi populares, vel Demici?]

This class includes fever, small-pox, plague, influenza, cholera, and the other diseases which have the peculiar character of suddenly attacking great numbers of people at intervals in unfavourable sanitary conditions. The diseases of this class distinguish one country from another—one year from another; they have formed epochs in chronology; and, as Niebuhr has shown, have influenced not only the fate of cities, such as Athens and Florence, but of empires; they decimate armies, disable fleets; they take the lives of criminals that justice has not condemned; they redouble the dangers of crowded hospitals; they infest the habitations of the poor, and strike the artisan in his strength down from comfort into helpless poverty; they carry away the infant from the mother's breast, and the old man at the end of life; but their direct eruptions are excessively fatal to men in the prime and vigour of age.

Pestilence and famine have always obtained the special attention of governments; and epidemical maladies have a special claim now to the attention of the statist, inasmuch as by prophylactic methods, of which vaccination is an example, and by hygienic arrangements, the ravages of epidemics may be greatly diminished. They are more than other diseases under public control, and may be diminished to a large extent by sanitary measures.

The diseases of the class may be referred conveniently to four groups, of which (1) fever, (2) syphilis, (3) scurvy, and (4) worms, are types.

New names are wanted to designate new groups of phenomena, which might perhaps be less equivocally designated by letters of the alphabet; but, to assist the memory, words have been employed which, by their etymology, will suggest the group. We do not, however, in any case accept the etymological sense as a *definition* or a *description* of the group of causes which a name designates. Thus, parts of the body undergo a specific transformation in the diseases of the first class, and they have been designated ZYMOTIC DISEASES (*Zymotici*) in England, without any intention to imply that these diseases are fermentations.

The list has been drawn up so as to include all the principal diseases which have prevailed as epidemics or endemics; and all those which are communicable either by human contract or by animals in a state of disease, as well as the diseases that result from the scarcity and the deterioration of the necessary kinds of food, or from parasitic animals.

The *Miasmatic diseases* (Order 1) are diffusible through the air or water, and are attended by fevers of various forms; the matter by which they are communicated is derived from the human body (as in small-pox) or from the earth (as in ague). (Types: small-pox, ague.)

The *Enthetic diseases* (Order 2) (from *ενθετος*, put in, implanted) may be properly called *contagious*, as they are communicated by contract, puncture, or inoculation. (Types: syphilis, glanders). The venom passes through the skin.

The *Dietic diseases* (Order 3) arise when the blood is supplied with improper or bad food. (Types: scurvy, ergotism.)

The *Parasitic diseases* (Order 4.) attack especially dirty populations, and infest the skin, the intestinal canal, and all the structures of the body. They are rarely fatal; and many pathologists contend that the parasitic vegetable or animal products are the accidental consequences of the diseases which they accompany.

The subsequent diseases fall under two great classes differing most in the property which those of the first class have of pervading several organs at once, or in succession; while the diseases of the other class consist essentially of functional or structural derangements of particular organs of the human body.

CLASS II.—CONSTITUTIONAL DISEASES.—*Cachectici*.

The diseases of this class are sporadic; they are sometimes discovered to be hereditary; they are rarely confined to one part, but before death ensues they affect several organs, in which new morbid products are often deposited.

The *first* order of *Diathetic diseases* includes gout, dropsy, cancer, mortification.

The *second* order of *tubercular diseases* includes scrofula, tabes mesenterica, consumption, and hydrocephalus.

CLASS III.—LOCAL DISEASES.—*Monorganici*.

There are sporadic diseases, in which the functions of particular organs or systems are disturbed or obliterated with or without *inflammation* and its products: some of the diseases are hereditary.

The diseases of the brain, spinal marrow, and nerves, form the first order (1), under the designation of the diseases of the nervous system, or, more briefly, brain diseases. The diseases of the organs (2) of circulation, (3) of respiration, (4) of digestion, and (5) of the urinary, (6) reproductive, (7) locomotive, and (8) integumentary systems, constitute eight orders of local diseases.

[The division into general and local diseases is found to work well; as functional disorder is more easily discovered than the precise nature of the lesions of internal organs which are rarely examined after death. The evidence may be sufficient to show that there is disease in the brain, or the chest, or the intestines, but may not enable the observer to determine whether it is or is not the result of inflammation. Such cases are classed as “diseases of the brain,” &c.]

CLASS IV.—DEVELOPMENTAL DISEASES.—*Metamorphici*.

The *fœtus in utero*, the infant prematurely born, the infant in the act of birth, or shortly after birth; the child in the first or second teething; the boy or the girl at the age of puberty; the woman in childbirth, or at the critical age when the reproductive function ceases; the person of advanced

age—are all liable to peculiar disorders, which in certain instances are causes of death, and are in the common nomenclature designated “still-birth,” “premature birth,” “infantile debility,” “malformation,” “teething,” “chlorosis,” “childbirth,” “climacteric disease,” “old age.” We place all the cases in this class apart, and join with them atrophy or asthenia, and what is sometimes called “premature old age,” in which the nutritive process is interrupted, without other evident disease. They are all the incidental attendants on the formative, reproductive, and nutritive processes; or the results of undetected diseases at the periods of life when those processes undergo great changes.

CLASS V.—VIOLENT DEATHS OR DISEASES.—*Thanatici*.

All the preceding diseases are modified, and some are induced, by external agents; but the present class comprises the evident results of physical and chemical forces acting on the organization. Burns, asphyxias, wounds, poisonings, stings, are types of the several sub-orders of the class.

Fire, asphyxia, mechanical forces, poisons, stings, induce specific diseases, which present a regular succession of phenomena, and should in all cases have names. Thus, as it is the “burn” and not the fire that is the cause of death; so it is the disease to which “arsenic” gives rise, rather than the arsenic, that we should register.

Human agency plays so important a part in this class, that it might be made the basis of the division into orders. Thus a man may die (1) a glorious death in battle (*pro patriâ mori*); he may die (2) by an act of homicide (murder, manslaughter); he may die (3) ignominiously on the scaffold (execution); or, (4) abandoning the post in which God has placed him, he may take away his own life (suicide); (5) he may die by a surgical operation; and (6) he may die by *accident*.

If this grouping be adopted, the mode in which death is produced by wounds, chemical injuries, poisons, asphyxias, and mechanical forces, would form secondary heads.

SECONDARY ANALYSIS OF CAUSES OF DEATH.

At the instance of the Registrar General, instructions have been prepared under the several heads of the *Nosology*, for the use of medical men and coroners in England.* In the several countries of Europe similar instructions would be required, and might be modified so as to meet the peculiar circumstances of each nation.

The most important point to attend to in the instructions is the registration of the *secondary diseases* which intervene in the course of other diseases, and the record of the duration of every fatal disease.

To render the analysis of the *causes of death* complete, it will be necessary to subject a certain number of them to a *second analysis*; showing, for example, the various ways in which *childbirth* is fatal, the circumstances in which *fatal accidents* occur, the cases of *measles* that terminate in *bronchitis* or *pneumonia*, of *scarlatina* that pass into *dropsy*, and the *duration* of each fatal case. These analyses would be interesting chiefly to medical statisticians.

CONCLUSION.

I have thus sketched in outline the classification of diseases from the statistical point of view, and have arranged them all under the five groups

* Copies of the *Statistical Nosology* may be had by qualified Medical Practitioners, on application to the Registrar General.

of Epidemic diseases (zymotici or demici), Constitutional diseases (cachectici), Local diseases (monorganici), Developmental diseases (metamorphici), and diseases that are the direct result of violence (thanati).

The general statist will gain a notion of the three first classes, by comparing them with the disorders arising in a most elaborate machine—from electrical, magnetic, or chemical action, and from the wear and tear of its particular parts. The fourth class is exemplified by defects of construction and by general decay. The fifth class is represented by the act of breaking the machine to pieces, disintegrating its parts, and putting an end to its movements, which when once stopped cannot be recommenced.

By studying the causes which are injurious and fatal to men in our countries and in our cities, statisticians will contribute to the removal of evils which shorten human life and to the improvement of the race of men, so that citizens of civilized States may be made to excel barbarians as much in strength as they do in the arts of peace and of war.

In the words of Bacon, “If physicians [and we may add governments] will learn and use the true approaches and avenues of nature, they may assume as much as the poet saith—

“*Et quoniam variant morbi, variabimus artes ;*
“*Mille mali species, mille salutis erunt.*”

FORM OF MEDICAL CERTIFICATE OF THE CAUSE OF DEATH [IN USE IN ENGLAND].

To the Registrar of the Sub-district in which the Death took place.

I hereby certify that I attended *John Jones, Carpenter*, aged *21 years* last Birthday; that I last saw *him* on *January 11th*, 1847, that he died on *January 12*, 1847, at *7, King Street, Mary-le-bone*, and that the cause of *his* death was

	Cause of Death.	Duration of Diseases.	Signed, <i>Edward Lawrence</i> .
(a) First.			Prof ^l Title, <i>M.D.</i>
(b) Second.	<i>Typhus</i> -	<i>19 days</i>	Address, <i>15, Soho Square</i> .
	<i>Pneumonia</i> -	<i>3 days</i>	

Suggestions to [English] Medical Practitioners respecting the mode of returning the Causes of Death.

(1.) State the causes of death in terms as precise and brief as possible; and use, if convenient, the names recommended in the Nosology, for the sake of uniformity. The space assigned for the entry in the Register Book will contain *about ten words*.

(2.) Write the causes of death, where there are more than one, under each other, *in the order of their appearance*, and not in the presumed order of their importance.

(3.) The duration of primary and secondary diseases in these returns will always be considered to imply the time intervening between the first appearance of well-marked characteristic symptoms and death. Small-pox, scarlatina, erysipelas, typhus, and all febrile and inflammatory diseases,

should, however, be dated from the rigours and symptoms, not from the later appearance of the eruptions, &c. The time in the certificate, opposite the primary disease will, therefore, include the whole term of illness. Thus:—

{	Scarlatina maligna	-	-	-	21 days.
{	Purulent infiltration	-	-	-	7 days (p.m.)

implies that the earliest symptoms of scarlatina occurred 21 days before death, that 7 days before death purulent infiltration was observed, and that a *post mortem* inspection of the body was instituted. So—

{	Hooping cough	-	-	-	16 weeks.
{	Paralysis of motor nerves (right side)	-	-	-	4 weeks.
{	Pneumonia	-	-	-	3 weeks.

is understood to mean that symptoms of the cough appeared 16 weeks, of the paralysis 4 weeks, of the pneumonia 3 weeks before death. Confusion has been produced in some returns by inattention to this point.

{	Childbirth	-	-	-	4 days (<i>from commencement of labour to death must be invariably understood</i>).
{	Metria	-	-	-	3 days (<i>from first symptoms till death</i>).
{	Childbirth	-	-	-	7 days
{	Placenta prævia, with profuse hæmorrhage,	-	-	-	
{	Diarrhœa	-	-	-	4 days
{	Smallpox	-	-	-	23 days (<i>from first rigours till death understood</i>).
{	Convulsions	-	-	-	20 hours (<i>before death</i>).
{	Vaccinated with doubtful effect 3 years ago.	-	-	-	
{	Smallpox (confluent)	-	-	-	21 days
{	first attack.	-	-	-	
{	vaccinated 8 years ago—one good cicatrix.	-	-	-	

The term “vaccinated” is preferable to “after vaccination,” for the latter as generally employed is ambiguous.

By the method now recommended, the use of conjunctive particles and other unimportant words is avoided. “Delirium tremens, brought on by excessive drinking of spirituous liquors (6 days),” might be abridged thus:—

{	Excessive use of spirits	-	-	-	
{	Delirium tremens	-	-	-	6 days

The former arrangement does not show clearly to what the *duration* (6 days) refers.

No attempt should be made to guess the duration of *latent* stages of diseases; but it will generally be possible to fix on a point of time near the access, when the patient had *no symptoms* of disease, and another, when the symptoms were unequivocal; if the disease be dated from the middle point of the intervening time, the results will admit of comparison. The duration should be stated in *minutes* or *hours*, when the disease is fatal in less than 48 hours; in *days*, in diseases of less than 50 days' duration; in *weeks* or *years*, for diseases of still longer duration. *Month* is an uncertain *measure* of time; when used in the returns, it will be deemed the *twelfth* part of a year.

(4.) State, in fatal cases of SMALL-POX, whether VACCINATION had been performed WITH EFFECT, and WHEN; and in smallpox, measles, scarlatina, typhus, rheumatism, mania, delirium tremens, apoplexy, and the like diseases, whether it be the second, third, &c. attack, whenever the patient has sustained more attacks than one. In ague, epilepsy, convulsive diseases, angina pectoris, syncope, and other maladies which occur in fits

or paroxysms, date the illness from the first fit ; and add the duration of the last fatal fit ; thus, *epilepsy 5 years ; last fit 6 hours.*

(5.) SURGEONS, in all cases of operation, should return (*a*) the primary disease or injury ; (*b*) the operation ; (*c*) the secondary diseases, such as erysipelas, purulent deposits, &c. and should state also the time from commencement of the primary diseases—the time from the operation—and the time from the appearance of secondary disease, *reckoning in each instance to the death.* Example :

{	Femoral hernia	-	-	-	-	3 years.
	Strangulated	-	-	-	-	70 hours.
	Operation	-	-	-	-	60 hours.
	Peritonitis	-	-	-	-	45 hours.
Heart and kidneys diseased (p.m.)						

(6.) It sometimes happens that the nature of the fatal disease cannot be discovered— even after a *post mortem* examination of all the organs— and still more frequently in the absence of an examination. *In such cases it is better to name one or more of the leading symptoms and peculiar appearances* than to assign a specific cause on imperfect, inadequate evidence. P.M. should be added when the causes of death have been verified by a post mortem inspection.

(7.) Certificates of the causes of death are received from Members of the Colleges of Physicians and Surgeons ; Licentiates of the London Society of Apothecaries ; Medical Graduates of an University ; Practitioners legally qualified by having been in practice before 1815.

If the forms should by accident fall into the hands of any UNQUALIFIED PRACTITIONER, he is recommended not to fill them up.

STATISTICAL NOSOLOGY.

[NOTE.—The latinized names of classes and of orders are derived from Greek roots, which may help the memory, and suggest, but will never define, the classes. The English names of classes are used in nearly the ordinary senses, and “constitutional” here legitimately acquires a definite meaning. Instead of “Diseases of the Nervous System,” I have employed the name “Brain Diseases;” thus designating by the name of the principal organ the diseases of all the divisions of this great system. On the same principle the diseases of the circulatory, respiratory, digestive, urinary, reproductive, locomotive, and integumentary systems are named.]

(Z.) I. ZYMOTIC DISEASES :—*Zymotici*. (ζύμη, leaven.)

Diseases that are either epidemic, endemic, or contagious; induced by some specific body, or by the want or by the bad quality of food.

(C.) II. CONSTITUTIONAL DISEASES :—*Cachectici*. (καχεξία, bad habit of body.)

Sporadic diseases; affecting several organs in which new morbid products are often deposited; sometimes hereditary.

(L.) III. LOCAL DISEASES : *Monorganici*. (μῦνος, alone, without others; ὄργανον, organ.)

Sporadic diseases, in which the functions of particular organs or systems are disturbed or obliterated, with or without *inflammation*; sometimes hereditary.

(D.) IV. DEVELOPMENTAL DISEASES :—*Metamorphici*. (μεταμόρφωσις, change of form.)

Special diseases, the incidental result of the formative, reproductive, and nutritive processes.

(V.) V. VIOLENT DISEASES OR DEATHS :—*Thanatici*. (θάνατοι, violent deaths.)

Diseases which are the evident and direct results of physical or chemical forces, acting either by the will of the sufferer, of other persons, or accidentally.

Order.

CLASS I.—1. Miasmatic diseases :—*Miasmatici*. (μίασμα, stain, defilement.)

2. Enthetic diseases :—*Enthetici*. (ἐνθετος, put in; implanted.)

3. Dietic diseases :—*Dietici*. (δίαιτα, way of life; diet.)

4. Parasitic diseases :—*Parasitici*. (παράσιτος, parasite.)

CLASS II.—1. Diathetic diseases : *Diathetici*. (διάθεσις, condition, diathesis.)

2. Tubercular diseases :—*Phthisici*. (φθίσις, wasting away.)

CLASS III.—1. Brain diseases :—*Cephalici*. (κεφαλή, head.)

2. Heart diseases :—*Cardiaci*. (καρδία, heart.)

3. Lung diseases :—*Pneumonici*. (πνεύμων, lung.)

4. Bowel diseases :—*Enterici*. (έντερον, intestine.)

5. Kidney diseases :—*Nephritici*. (νεφρός, kidney.)

6. Genetic diseases :—*Aidoici*. (αἰδοῖα, pudenda.)

7. Bone and muscle diseases :—*Myostici*. (μῦς, muscle; ὀστέον bone.)

8. Skin diseases :—*Chrotici*. (χρῶς, skin.)

- CLASS IV.—1. Developmental diseases of children:—Paidiaci. (παιδία, youth.)
 2. Developmental diseases of women:—Gyniaci. (γυνή, woman.)
 3. Developmental diseases of old people:—Geratici. (γῆρας, old age.)
 4. Diseases of nutrition:—Atrophici. (ἀτροφία, atrophy.)

- CLASS V.—1. Accident:—Tychici. (τύχη, chance.)
 2. Battle:—Polemici. (πόλεμος, a battle, fight.)
 3. Homicide:—Androphonici. } (ἀνὴρ, man; αὐτὸς, self;
 4. Suicide:—Autophonici. } φονεύω, I murder, kill.)
 5. Execution:—Demiotici. (δημιώτης, executioner.)

CLASS I. ZYMOTIC DISEASES.—*Zymotici*.

ORDER 1.—*Miasmatici*.

[N.B.—Medical men of the respective nations are requested to employ these names whenever they are applicable in certifying the cause of death, and in Statistical Tables. Only the names in capital letters are now required in the Tables of the CAUSES OF DEATH.]

<i>English.</i>	<i>Latin.</i>	<i>French.</i>	<i>German.</i>
SMALL POX. Varioloid.	Variola. Varioloides.	Variole. Varioloide.	Wahre oder Menschen-pocken, oder Menschen-Blattern.

CHOLERA.	Cholera.	Choléra.	Cholera.
Yellow Fever.	Typhus icterodes.	Fièvre jaune.	Gelbes Fieber.
REMITTENT FEVER.	Febris remittens	Fièvre rémittente.	Remittent-Fieber.
(Hong Kong and other fevers.)	Febris tropicorum.	Fièvre des tropiques.	
AGUE.	Febris intermittens.	Fièvre intermittente.	Wechselfieber.
RHEUMATISM.	Rheumatismus acutus. (Febris rheumatica.)	Rheumatisme.	Rheumatismus.

ORDER 2.—*Enthetici.*

SYPHILIS (primary).	Syphilis (primarius).	Syphilis (primitive).	Primäre Syphilis.
Syphilis (secondary).	Syphilis (secundarius).	Syphilis (secondaire).	Secundäre Syphilis.
Gonorrhœa.	Gonorrhœa.	Gonorrhée.	Tripper.
Leprosy.	Lepa.	Lépre.	Aussatz.
Including Greek Elephantiasis, or the leprosy of Moses. Aleppo evil, yaws, pellagra, radesyge, are endemic in some countries.			
Purulent ophthalmia.	Ophthalmia purulenta.	Ophthalmie purulente.	
Glanders.	Equinia (<i>new</i>).	Morve.	Rotz.
HYDROPHOBIA.	Rabies.	Hydrophobie.	Wasserscheu.
Necusia.	Necusia (<i>new</i>).	Infection par piqûre de dissection.	Sections-gift oder -Wunden.
(Infection by puncture in dissection.)			
Malignant pustule.	Pustula maligna.	Pustule maligne.	Milzbrandcarbunkel.

ORDER 3.—*Dietici.*

Famine fever.	Febris à fame.	Fièvre de faim.	Hungerfieber.
Scurvy.	Scorbutus.	Scorbut.	Scorbut.
PURPURA.	Purpura.	Purpura.	Purpura oder Blutflecken Krankheit.
†Rickets (?)	Rachitis. (?)	Rachitisme. (?)	Englische Krankheit.
†Bronchocele. (?)	Bronchocele. (?)	Bronchocele (?)	Kropf.
†Cretinism. (?)	Cretinismus. (?)	Crétinisme. (?)	
Ergotism.	Ergotismus.	Ergotisme.	Mutterkornvergiftung
Alcoholism.	Alcoholismus.	Alcoholisme.	Trunksucht oder Säüferdyskrasie.
(Includes Intemperance, Delirium Tremens, and Catacausis.)			

ORDER 4.—*Parasitici.*

THRUSH.	Aphtha.	Aphthe.	Schwämmchen.
Porrigo.	Porrigo.	Porrigo.	Kopfgrind.
Scabies.	Scabies.	Scabies ou Gale.	Krätze, Milbenkrätze.
Phthiriasis.	Morbus pedicularis.	Phthiriase.	Läusesucht.

* Includes the epidemic pleurisy and pneumonia.

† Until the direct cause of these diseases is determined, they are inserted in this class.

Mr George [Rose] was the intimate
friend of the two brothers Jos. Horace
Smith, but he never caught the higher
abilities of one or of either of them.
There was a time when Lit. was
prevalent, & it was mostly revealed in
Canning, Moore, Byron, Smith & Lathell."

Albion, p 361.

1877

Ms 2604. ²² 1877.

To Remembrance of Mr. Geo. Rose,
Ms. J. R. L.

<i>English.</i>	<i>Latin.</i>	<i>French.</i>	<i>German.</i>
WORMS.	Vermes.	Entozoaires.	Wurmsucht.
(a.) Hydatids.	Acephalocystis, echinococcus hominis.	Hydatides.	Hydatiden, Echinococcus.
(b.) Tape worm.	Tænia solium.	Ténia (ver solitaire).	Bandwurm.
(c.) Strongilus Gigas.	Strongilus Gigas.	Strongle géant.	
(d.) Round worm.	Ascaris Lumbricoides.	Ascaride lombricoïde.	Spulwurm.
(e.) Thread worm.	Ascaris Vermicularis.	Ascaride vermiculaire.	Fadenwurm.
(f.) Guinea worm.	Dracunculus.		Guineawurm.

CLASS II.—CONSTITUTIONAL DISEASES.—*Cachectici.*ORDER 1.—*Diathetici.*

GOUT.	Podagra.	Goutte.	Gicht.
Anæmia.	Anæmia.	Anhémie.	Blutarmuth, Bleichsucht.
DROPSY.	Hydrops.	Hydropisie.	Wassersucht.
CANCER (soft) of	Carcinoma encephaloides.	Cancer encephalöide.	Encephalöid.
Cancer (colloid).	Carcinoma alveolare.	Cancer alvéolaire.	Alveolarkrebs.
Cancer (osteoid).	Carcinoma osteoides.	Cancer ostéoïde.	Knochenkrebs.
Cancer (scirrhus).	Scirrhus.	Squirre.	Scirrhus.
Cancer (epithelial). (Sweep's cancer, &c.)	Carcinoma epitheliale.	Carcinome épithélial.	Hautkrebs, Epithelisma.
Melanosis.	Melanosis.	Mélanose.	Melanose, Schwarzer Krebs.
Lupus.	Lupus.	Lupus.	Wasserkrebs.
CANKER.	Noma.	Noma.	
MORTIFICATION.	Gangræna.	Gangrène.	Brand, Gangraen.
Dry Gangrene.	Gangræna senilis.	Gangrène sénile.	Trockner Brand, Sphacelus.
Bed-sore.			

(Refer hæmorrhage, abscess, ulcer, tumour, to the organs affected.)

ORDER 2.—*Phthisici.*

SCROFULA.	Scrofula.	Scrofule.	Scropheln.
(a) Psoas abscess.	Abscessus psoanus.	Abscès du psoas.	Lendenmuskelabscees.
White swelling.			Gekrösschwindsucht.
TUBERCULOSIS MENTERICA.	Tuberculosis Mesenterica.	Tuberculose.	Tuberculose Bauchfellentzündung.
Tubercular peritonitis.	Peritonitis tuberculosa.	Péritonite tuberculeuse.	
PHTHISIS. (Hæmoptysis).	Phthisis. (Hæmoptysis.)	Phthisie. (Hémoptysie).	Schwindsucht. (Blutspucken.)
HYDROCEPHALUS, (with tubercular deposit).	Hydrocephalus. Meningia tuberculosa.	Hydrocéphale. Meningite tuberculeuse.	Wasserkopf.

CLASS III.—LOCAL DISEASES.—*Monorganici.*ORDER 1.—*Cephalici.*

<i>English.</i>	<i>Latin.</i>	<i>French.</i>	<i>German.</i>
Meningitis.	Meningitis.	Meningite.	Meningitis.
Encephalitis (including acute hydrocephalus).	Encephalitis.	Encéphalite.	Gehirnentzündung und Acuter Wasser- kopf.
CEPHALITIS.	Cephalitis.	Céphalite.	Cephalitis.
Myelitis.	Myelitis.	Myélite.	Rückenmarkentzün- dung.
APOPLEXY.	Apoplexia.	Apoplexie.	Schlagfluss, Nerven- schlag.
PARALYSIS (of).	Paralysis.	Paralysie.	Lähmung.
Shaking palsy.	Paralysis agitans.		Zitterkrampf.
CHOREA.	Chorea.	Chorée (danse de Saint Guy).	Veitstanz.
DELIRIUM TREMENS.	Delirium tremens.		Säuferwahnsinn.
MANIA.*	Mania.	Folie.	Manie.
Monomania.	Monomania.	Monomanie.	Monomanie.
Dementia.	Dementia.	Démence.	
EPILEPSY.	Epilepsia.	Epilepsie.	Fallsucht.
Hysteria.	Hysteria.	Hystérie.	Muttersucht.
TETANUS.	Tetanus.	Tétanos.	Starrkrampf.
CONVULSIONS.	Convulsio (?)	Convulsions.	Krämpfe.
	Eclampsia.	Eclampsie.	Krampf der Gebären- den.
Laryngismus.	Laryngismus.	Laryngisme.	
Neuralgia.	} Neuralgia.	Névralgie.	Neuralgie.
(Tic Douloureux).			
Neuroma.	Neuroma.	Névrôme.	
Ophthalmitis.	Ophthalmitis.	Ophthalmie.	Augenentzündung.
Blindness.	Cæcitas.	Cécité.	Blindheit.
Otitis.	Otitis.	Otite.	Ohrentzündung.
Deafness.	Surditas.	Surdité.	Taubheit.

ORDER 2.—*Cardiaci.*

Carditis.	Carditis.	Cardite.	
PERICARDITIS.	Pericarditis.	Péricardite.	Herzbeutelentzün- dung.
Endocarditis.	Endocarditis.	Endocardite.	
DISEASE of HEART valves.	Morbus cordis val- vularum.	Maladie des valvules du cœur.	Klappenfehler.
Heart hypertrophy.	Hypertrophia cordis.	Hypertrophie du cœur.	Herzhypertrophie.
Heart atrophy.	Atrophia cordis.	Atrophie du cœur.	Herzatrophie.
Heart fatty degene- ration.	Cordis degeneratio.	Dégénérescence du cœur.	Fettige herzentart- ung.

* Fright, excessive laughter, grief, and some other mental affections, are in rare instances returned as causes of death.

<i>English.</i>	<i>Latin.</i>	<i>French.</i>	<i>German.</i>
ANEURISM of the HEART— —— of the Aorta, aortæ, &c. of popliteal artery, &c.	Aneurisma cordis—	Anévrisme du cœur.	Herzaneurisma.
Angina pectoris.	Angina pectoris.	Angine pectorale.	Brustbraune.
Fainting.	Syncope.	Syncope.	Ohnmacht.
Arteritis.	Arteritis.	Artérite.	
Atheroma (of arte- ries).	Atheroma (arteri- arum.)	Athérome (des artè- res).	Atheroma.
Phlebitis.	Phlebitis.	Phlebite.	Venenentzündung.
Varicose veins.	Varix.	Varices.	Krampfadern.

ORDER 3.—*Pneumonicæ.*

Epistaxis.	Epistaxis.	Epistaxis.	Nasenbluten.
LARYNGITIS (Œdema of the glottis).	Laryngitis. (Œdema glottidis.)	Laryngite. (Œdème de la glotte.)	Kehlkopfentzündung. (Stimmmentzündung.)
Laryngismus stridu- lus.	Laryngismus stridu- lus.	Pseudo-croup.	Stimmritzenkrampf.
BRONCHITIS.	Bronchitis.	Bronchite.	Luftrohrenentzün- dung.
PLEURISY.	Pleuritis.	Pleurésie.	Brustfellentzündung.
Hydrothorax.	Hydrothorax.	Hydrothorax.	Brustwassersucht.
Empyema.	Empyema.	Empyème.	Empyem.
Pneumothorax.	Pneumothorax.	Pneumothorax.	
Congestion of lungs.	Apoplexia pulmo- nalis.	Apoplexie pulmo- naire.	Lungenschlag.
PNEUMONIA.	Pneumonia.	Pneumonie.	Lungenentzündung.
Pleuripneumonitis.	Pleuripneumonitis.	Pleuripneumonie.	Brustfell und lungen- entzündung.
ASTHMA.	Asthma.	Asthme.	Engbrustigkeit.
Emphysema (of lungs).	Emphysema.	Emphysème des pou- mons.	Emphysem.
Grinder's asthma.	Asthma tritorum.		Grinder'sches Asthma*
Miner's asthma.	Asthma metalli- corum.		Miner'sche Asthma.
Spurious mela- nosis.			Unächte Melanose.

ORDER 4.—*Enterici.*

Glossitis.	Glossitis.	Glossite.	Zungenentzündung.
Stomatitis.	Stomatitis.	Stomatite.	Mundentzündung.
Pharyngitis.	Pharyngitis.	Pharyngite.	Schlundkopfentzün- dung.
Œsophagitis.	Œsophagitis.	Œsophagite.	Speiseröhrnentzün- dung.
GASTRITIS.	Gastritis.	Gastrite.	Magenentzündung.
ENTERITIS.	Enteritis.	Entérite.	Darmentzündung.
PERITONITIS.	Peritonitis.	Péritonite.	Bauchfellentzündung.
ILEUS.	Ileus.	Ileus.	Kothbrechen.
(Constipation.)	(Constipatio.)	(Constipation.)	(Verstopfung.)
INTUSSUSCEPTION.	Intussusceptio.	Intussusception.	Darmverschlingung, Volvulus.

<i>English.</i>	<i>Latin.</i>	<i>French.</i>	<i>German.</i>
HERNIA.	Hernia.	Hernie.	Engeweidebrüche.
(Congenital.)	(Congenitalis.)	(Congénitale.)	Angeborener Bruch.
(Femoral.)	(Femoralis.)	(Fémorale.)	Schenkelhalsbruch.
(Inguinal.)	(Inguinalis.)	(Inguinale.)	Leistenbruch.
(Scrotal.)	(Scrotalis.)	(Scrotale.)	Hodenbruch.
(Umbilical.)	(Umbilicalis.)	(Ombilicale.)	Nabelbruch.
(Ventral.)	(Ventralis.)	(Abdominale.)	Bauchbruch.
STRICTURE (of ili- um, &c.)	Contractura (ilii, &c.)	Contracture (de l'iléon etc.)	Dünndarmverenge- rung.
ULCERATION (of ilium, &c.)	Ulcus (ilii, &c.)	Ulcération (de l'iléon, etc.)	Dünndarmverschwä- rung.
Perforation (of ili- um, &c.)	Perforatio (ilii, &c.)	Perforation (de l'iléon, etc.)	Dünndarmperfora- tion.
Dyspepsia.	Dyspepsia.	Dyspepsie.	Dyspepsie.
Pyrosis.	Pyrosis.	Pyrosis.	Sodbrennen.
Gastralgia.	Gastralgia.	Gastralgie.	Gastralgie.
Hæmatemesis.	Hæmatemesis.	Hématémèse.	Blutbrechen.
Melæna.	Melæna.	Mélené.	
Hæmorrhoids.	Hæmorrhoids.	Hémorrhôides.	Hämorrhoiden.
FISTULA.	Fistula.	Fistule.	Fistel.
PANCREATIC DISEASE.	Morbus Pancreati- cus.	Pancréatie.	Entzündung der Pancreas.
SPLENITIS.	Splenitis,	Splénite.	——— der Milz.
HEPATITIS.	Hepatitis.	Hépatite.	——— der Leber.
JAUNDICE.	Icterus.	Ictère.	Gelbsucht.
Gall stones.	Chololithus.	Calcul biliaire.	Gallensteine.
Cirrhosis.	Cirrhosis.	Cirrhose.	Cirrhose ; granulirte Leber.
ASCITES.	Ascites.	Ascite.	Bauchwassersucht.

ORDER 5.—*Nephritici.*

NEPHRITIS.	Nephritis.	Néphrite.	Nierenentzündung.
ISCHURIA.	Ischuria.	Isch rie.	Harnverhaltung.
Diuresis.	Diuresis.	Diurèse.	Unvermogen den Harn zu halten.
NEPHRIA. (Bright's disease, Albuminuria.)	Nephria.	Néphrine.	Bright'sche Krank- heit.
DIABETES.	Diabetes.	Diabète.	Harnruhr.
STONE. (Uric acid, &c.)	Calculus.	Calcul.	Steinkrankheit.
Gravel.	Calculus.	Gravelle.	Harngries.
Hæmaturia.	Hæmaturia.	Hématurie.	Blutharnen.
CYSTITIS.	Cystitis.	Cystite.	Blasenentzündung.
Disease of the pro- state gland.	Morbus prostaticus.	Prostatite.	Vorsteherdrüsen- krankheit.
CONTRACTURA URETHRÆ.	Contractura urethræ.	Uréthrosténie.	Verengerung der Harnröhre.

ORDER 6.—*Gennetici.*

Varicocele.	Varicocele.	Varicocèle.	Krampfaderbruch.
Orchitis.	Orchitis.	Orchite.	Hodenentzündung.
Hydrocele.	Hydrocele.	Hydrocèle.	Wasserbruch.

<u>English.</u>	<u>Latin.</u>	<u>French.</u>	<u>German.</u>
Hysteritis.	Hysteritis.	Hystérite.	Gebärmutterentzündung.
OVARIAN DROPSY.	Hydrops ovarii.	Ovarémie.	Eierstockswassersucht.
Ovarian tumor.	Tumor ovarii.	Ovarite.	Eierstocksgeschwülste.
Uterine tumor.	Tumor uteri.	Tumeur utérine.	Uterusgeschwülste.
Polypus of uterus.	Polypus uteri.	Polypes de l'utérus.	Uteruspolypen.

ORDER 7.—*Myostici.*

SYNOVITIS.	Synovitis.	Synovite.	Gelenkkapselentzündung.
Ostitis, (including periostitis and endostitis).	Ostitis.	Ostéite.	Knochen- und Knochenhaut-Entzündung.
Exostosis.	Exostosis.	Exostose.	Exostose.
Brittle-bones.	Fragilitas ossium.		
Soft-bones.	Mollities ossium.	Ostéomalacie.	Knochenerweichung.
Curvature of spine.	Curvatura spinæ.		
Caries.	Caries.	Carie.	Rückgrathverkrümmung.
Necrosis.	Necrosis. (Fractura ossis—vide Class V.)	Nécrose.	Knochenfrass.
Muscular atrophy.	Atrophia musculorum.	Atrophie musculaire.	Muskelatrophie.

ORDER 8.—*Chrotici.*

Roseola.	Roseola.	Roséole.	Reseola.
Urticaria.	Urticaria.	Urticaire.	Nesselfriesel.
Eczema.	Eczema.	Eczéma.	Eczem, Hitzbläschen
Herpes.	Herpes.	Herpès.	Herpes, Flechte.
Pemphigus.	Pemphigus.	Pemphigus.	Pemphigus, Blasen-ausschlag.
Rupia.	Rupia.	Rupia.	Rupia.
Ecthyma.	Ecthyma.	Ecthyma.	Ecthyma.
Impetigo.	Impetigo.	Impetigo.	Impetigo, Ansprung-nässender Grind, oder Pustelflechte.
Acne.	Acne.	Acné.	Acne, Finne.
Mentagra.	Mentagra.	Mentagre.	Mentagra, Bartfinne.
Lichen.	Lichen.	Lichen.	Lichen, Schwindknötchen.
Prurigo.	Prurigo.	Prurigo.	Prurigo, Hautjucken.
Psoriasis.	Psoriasis.	Psoriasis.	Psoriasis, Schuppen-grind.
Pityriasis.	Pityriasis.	Pityriasis.	Pityriasis, Hautkleie.
Ichthyosis.	Ichthyosis.	Ichthyose.	Ichthyosis, Fischhaut.
PHLEGMON.	Phlegmon.	Phlegmon.	Phlegmon.
Whitlow.	Paronychia.	Panaris.	Wurm, Panaritium.
Abscess (external).	Abscessus (externus).	Abscès.	Abscess.

CLASS IV.—DEVELOPMENTAL DISEASES :—*Metamorphici*.ORDER 1.—*Developmental Diseases of Children*:—*Paidiaci*.

<i>English.</i>	<i>Latin.</i>	<i>French.</i>	<i>German.</i>
Stillborn.	Natus mortuus.	Mort-né.	Todgeboren.
PREMATURE BIRTH.	Premature natus.	Accouchement pré-mature.	Unzeitiggeboren.
Atelectasis.	Atelectasis pulmonum.	Faiblesse.	Lungen-atelektasie.
Malformations:	Vitia conformationis:	Malformations:	Missbildungen:
Cyanosis.	Cyanosis.	Cyanose.	Cyanose.
Spina bifida.	Spina bifida.	Spina bifida.	Spina bifida.
Anus imperforatus.	Anus imperforatus.	Imperforation de l'anus.	Atresia ani.
Idiocy.	Fatuitas.	Idiotisme.	Idiotismus.
Congenital Deaf- Dumbness. }	Mutitas.	Sourd-mutité.	Taubstummheit.
Teething.	Dentitio.	Dentition.	Zahnung.

ORDER 2.—*Developmental Diseases of Women, chiefly in the Reproductive Age*:—*Gyniaci*.

Chlorosis.	Chlorosis.	Chlorose.	Bleichsucht.
CHILDBIRTH, Mis- carriage, Abor- tion. }	Partus, abortus.	Suites des couches.	Kindbett, Fehlgeburt.
(Including death from "pelvis deformed, rupture of uterus, extra-uterine foetation, flooding, puerperal mania, puerperal convulsions, syncope, hysteritis, breast abscess.") See also Metria, Class I. 1.			
Paramenia.	Paramenia.	Amenorrhée.	Unregelmässigkeit, oder Fehlen des Monats-flusses.
(Including amenorrhœa, leucorrhœa).			
Climacteria (turn of life).	Climacteria.	Temps critique.	Aufhören der Weiblichen Reinigung.

ORDER 3.—*Developmental Diseases of Old People*:—*Geratici*.

Old age.	Senectus.	Sénilité.	Altersschwäche.
----------	-----------	-----------	-----------------

ORDER 4.—*Diseases of Nutrition*:—*Atrophici*.

Atrophy, Debility, (includes prema- ture old age).	Atrophia, asthenia.	Atrophie.	Atrophie.
--	---------------------	-----------	-----------

CLASS V.—VIOLENT DEATHS OR DISEASES : *Thanatici*.ORDER 1.—*Accident*:—*Tychici*.

Suffocation.	Suffocatio.	Suffocation.	Erstickung.
Fracture, &c.	Fractura, &c.	Fracture de —.	Bruch.
Gunshot wound.	Vulnus a tormento.	Blessure.	Schusswunden.
Cut; Stab.	Vulnus cultro; sicâ.	Coupure; Piqure.	Schnittwunden.
Poison (by). Venenatio.	Empoisonnement.	Gift.
Privation.	Privatio.	Indigence.	Armuth.

ORDER 5.—*Execution :—Demiotici.*

Gunshot wound.	Vulnus a tormento.	Plaie d'arme à feu.	Schusswunden.
Beheading.	Decollatio.	Décapitation.	Enthauptung.
Hanging.	Suspendium.	Suspension.	Erhängen.

N.B.—In every case of violent death it should be stated in the register whether the death was (1st) *in battle*; or was (2d) *excusable* or *justifiable homicide*; (3d) *manslaughter*; (4th) *suicide*; (5th) *murder*, *infanticide*, *fratricide*, *parricide*; (6th) *execution*.

The *instruments* employed, where human agency is concerned, as well as the *animals*, *machines*, and *poisons* or other *bodies* whereby the injury is inflicted, should be stated in all cases. The *place* of death or of injury, and the *time* which elapsed between the infliction of the injury and death should also be recorded. At the same time, the statement should be made as concise as it is clear and comprehensive.

LISTS of CAUSES of DEATH ; for USE in the CONSTRUCTION of MORTUARY TABLES.

The following pages (pp. 94—96) contain two lists of causes of death. The first,—that on the left side,—may be called the TABULAR LIST, and comprises all the heads which it is proposed to admit into the complete tables, and under which ALL deaths, from whatever cause, must be distributed. It represents those diseases which, under the same terms, or terms strictly synonymous with them, are found in practice to occur most frequently in the English registers. If the list were extended, by admitting into it the numerous modifications of disease that appear in the registers, it is obvious that the sheets would be too cumbrous for working, and that the tables made from them would be inconvenient for reference. Opposite each head in the working sheet will be a line on which the deaths can be indicated by penmarks, and vertical lines will be drawn for the distinction of ages.

The SUPPLEMENTAL LIST is subordinate to the first, and contains the principal *special* diseases which it may be considered desirable to note. But it should be observed, that *every* case marked here must also be enumerated under one or other head in the tabular list. The tabular heads under which it is proposed to place such special cases are shown by references in figures. In distributing the special cases over the tables they should, of course, be referred to those heads to which they are most nearly allied. It will be found that the special cases are few, and will not affect the larger numbers in the tables to any important extent. In England it has been usual to note any special case by writing the *age* opposite the particular head. This list may be always extended at pleasure by the pen, but it is convenient to have as many *special diseases* as is possible within practicable limits, printed on the working sheet.

The diseases in the Supplemental List are separately tabulated.

CAUSES OF DEATH.

TABULAR LIST.

- | | | | | |
|------------|---|---|---|---|
| I. 1.—1. | Small-pox (variola) | - | - | - |
| 2. | Measles (morbilli) | - | - | - |

| 10. | Brain Disease, &c.* (morbus cerebri) | - | - | - |

In the working-sheet, now in use, which measures about 28 in. by 20 in., the several periods of life are printed across the page, and vertical lines are drawn from them, forming columns within which the marks are grouped. Thus a single operation serves the double purpose of showing how many persons died of any disease, and at what ages they died. The divisions of age run thus: 0 months, 3 months, 6 months, 1 year, 2, 3, 4, 5 years, and afterwards in quinquennial periods, up to 100 years.

REPORT

TO THE

REGISTRAR-GENERAL on the INTERNATIONAL STATISTICAL CONGRESS
held at Paris in 1855.

SIR,

*General Register Office,
October 1855.*

THE Statistical Congress was convened by the Government of the Emperor of the French, and met in Paris on September 10th, 1855. I was appointed to attend the Congress by you, and I had the honor to be associated on this occasion with Mr. Fonblanque and his assistant Mr. Valpy, of the Board of Trade. Viscount Ebrington and the Rev. Wyatt Edgill represented officially the London Statistical Society. Professor Leone Levi was delegated by some of the English Chambers of Commerce. The English representatives, with Dr. Greenhill, Dr. Balfour, Dr. Barnes, Dr. Johnson, Mr. Taylor, Mr. S. Brown, and others, attended in the sections where subjects with which they were most conversant were under discussion.

In conformity with the instructions of the Lords Commissioners of Her Majesty's Treasury, I have the honor to submit to you a Report on the proceedings of the Congress.

The Congress was in its first conception, and remains still, a purely practical institution: its main object is to bring the statistical information about the population, property, agriculture, industry, commerce, and administration of civilized states into forms, in some respects identical, in others analogous, and always admitting of strict and ready comparison.

In former ages the various governments of the world often concealed everything that could throw light on the condition of their people or on the resources of their states. When policy was a mystery it did not rely on truth, but on craft; and rarely took counsel of statistical science, which deals openly with facts, expressed in numbers, and seeks to apply to the affairs of nations the exact methods which in the hands of scientific men have already brought home from all the kingdoms of nature rich harvests for mankind.

The frank endeavours of the Governments of civilised states to enlighten and to aid each other, is a new and an auspicious sign.

In the programmes as well as in the discussions of Brussels and Paris, great discretion was exercised in eliminating everything that was likely to interfere with religious creeds or to excite the susceptibilities of nations living under different forms of government; and within the prescribed limits ample scope was found for discussions and inquiries, interesting to every government that has at heart the welfare of its people.

England sent a delegate to the first Congress; France was represented there officially by M. Legoyt; Austria was represented by Baron Czœrnig; Prussia by Mr. Dieterici; Spain by M. Ramon de la Sagra. Nearly all the small states and all the large states of Europe were represented, not only by men, like M. Villermé, eminent in statistical science, but by official delegates, except Russia, who did not send a representative to the Congress,

and thus isolating herself, refused to learn from the statistical science of Europe in 1853 the lessons which she has learnt by bitter experience in 1855 from the armies of England and France.

France pursued an entirely different course in 1853; and in 1855 a commission of eminent French statisticians having made the preliminary arrangements, M. Rouher, a leading minister, opened the session in an eloquent speech, and presided ably over the public sittings of the Congress at the Palace of the Legislature.

The Emperor, who, as it is well known, has himself cultivated the sciences, watched the proceedings with a lively interest, and very graciously expressed his satisfaction by receiving all the members of the Congress at the Tuileries.*

For the transaction of business, the Congress was subdivided into four sections, which met at nine o'clock in the morning, and worked every day in committee until one o'clock, when the Reports, as they were completed, were read, discussed, and voted at the public sittings. The following subjects were discussed and reported on by the Congress.

First section.—Statistical nosology; statistics of insanity; statistics of epidemics; statistics of accidents.

Second section.—Statistics of agriculture; statistics of roads, railways, and ways of water communication; statistics of foreign commerce.

Third section.—Judicial statistics, criminal and civil; table of crimes and offences, so declared by the penal legislation of each state; statistics of penitentiary establishments.

Fourth section.—Statistics of provident institutions; statistics of great cities.

By those who have compared the statistics of England with the statistics of other countries it is admitted that, both in the statistics of population and of commerce, we have many things that are worthy of their imitation. It will be, however, of most practical use to bring under your notice now only a few of the important deficiencies in English statistics, as indicated as well by the practices of certain states as by the opinions of the Congress.

The official account of the transactions, containing all the Reports, will be shortly published by the French Government. And I shall have the honor to submit to you the whole of the Reports and the Recommendations of the Congress as soon as I receive printed copies from M. Legoyt, the secretary.

I noticed in my first Report that the Congress recommended the construction of territorial maps on the scale of 1—2500 (=·0004), which is little less than the common English scale of $26\frac{2}{3}$ inches to a mile. A map of the territory and of the configuration of a country is the basis of its statistics; yet a map on the above scale, though commenced for some time, is making little progress in Great Britain.

A map on the larger scale of 1 in 500, was recommended by the Congress for towns.

With maps of this kind, on which every plot of ground in the kingdom is laid down, a registry of land and houses could be easily and accurately carried out. England is now divided into 628 districts, comprising sub-districts, which again are composed of townships or parishes; and each is referred to in the census index by numbers, on the plan of the books, chapters, and verses of the Bible. Thus in the last census 135; 1; 1; is the numerical designation of Hendon district (135); Harrow sub-district (1); Harrow-on-the-Hill parish (1). It is only necessary to add a

* See the closing speech of M. Rouher, Ministre du Commerce, de l'Agriculture, et des Travaux Publics, in the *Moniteur*, 16th September 1855.

fourth series of figures to designate each plot of ground, whether built on or not, whether it has or has not a name on the map ; and by its number and its relative position it could be immediately identified.

If the owner of each of the fields or plots of land in the country were registered before a competent court, and had stamped official copies of the register, with single counterparts of the map, numbered, the possession of land would be secured, and exchanges of ownership simplified. Titles of absolute ownership on this plan would be as brief as a five pound note, and leases for short or long terms would be equally brief ; partial, temporary, reversionary, certain or contingent ownership—of land laid down and identified on the great map, might be secured by titles of little more extent.

The Statistical Congress at Paris adverted to another evident use of a great map, on the same scale as some of the foreign maps : it would facilitate the operation of taking the breadth of land under various crops, and of determining the annual produce of the earth : agricultural statistics would become more accurate and less difficult.

The utility of a good system of annual agricultural returns is sufficiently apparent ; but the advantage of ascertaining every year, on a large scale, the produce of different soils, under different crops and different kinds of culture, through good and bad times, in every county of England, Scotland, and Ireland, has not been sufficiently noticed, any more than the advantages of determining the laws that regulate the growth and the mortality of every kind of stock, both in a scientific and practical point of view.

The English census of 1851 contains the best account extant of any people classified under ages and occupations ; but we have yet in England no industrial statistics—no complete account of the shops, workshops, manufactories, and great productive works of the United Kingdom—of their organization, or of their produce. The distribution of produce in the home markets is very imperfectly known.

It is evident that our commercial statistics must be imperfect under these circumstances. Mr. Fonblanque will report on this subject.

One of the reproaches with which this country was justly chargeable, at Brussels, as I reported to you, applies to it no longer. Scotland has now in operation a system under which the births and deaths are registered, as well as the greater part of the marriages. The practice of irregular surreptitious marriages, even to a limited extent, has undoubtedly been prejudicial to the staid morality, family life, and population of Scotland. It will, we may hope, soon cease, and then all the marriages will be registered.

Ireland has no civil registry of births or of deaths ; and the marriages of the protestant part of the community alone are registered by the Registrar General of Ireland. The statist of Europe hear of this defect with astonishment. It is in many ways injurious to the people of Ireland, as it renders the proof of their pedigree difficult ; and when they have occasion to insure their lives, and even at other times, they are deprived of the readiest way of proving their age. The sanitary state of the country also remains imperfectly known. At the census great expense is incurred in collecting from the living imperfect accounts of the numbers, ages, and diseases of the dead during the ten preceding years. A Registrar General and a registration staff already exist in Ireland ; so all that is required is that they should be enabled to do their work, and actually to register the births, deaths, and marriages of the population.

The cause of the neglect of registration in Ireland is misunderstood ; for by some it is viewed as a form of English oppression, by others it is ascribed to the opposition of the Roman catholic priests. Now England

has never offered any opposition to such a measure; and as civil registration exists in Belgium, France, and other Roman catholic countries, as well as in England and Scotland, it has evidently in it nothing incompatible with the practice of the Roman catholic church. Such arrangements should be made as might prevent any interference with the income that the priest, under the voluntary system in Ireland, necessarily draws from marriages, baptisms, and burials.

The English schedules in the Registration Act do not yet contain some important heads of information already in certain foreign schedules; and the measures under the Code Napoleon to secure the authenticity of the recorded facts are more likely to be effectual than the arrangements under the English Act. The registration of Brussels, which will illustrate the French system, is described in a separate paper.

The question of the *uniformity of weights, measures, and money* was not on the programme; but, adverting to the facility which common unities would afford to the comparative statistics of all countries, the Congress expressed a wish to see brought into use a uniform system.*

I shall not discuss this question here; but before a change so extensive in its operation can be carried out, it would, I think, be well that countries should agree to publish their statistics in their own weights, measures, or moneys, with an *additional column* expressing the relative quantities in some one standard. This standard, as regards measures and weights, should be the metrical decimal system, which, with some modern extensions, will be the best, and be the most likely to be generally adopted. It forms a symmetrical system, is generally applicable, and affords great facilities for every kind of calculation.

The quantities that we express in *yards* and *miles* would on this plan likewise be expressed, in the principal English Tables, in *meters* and *kilometers*; the meter being not 1-10th more than a yard, the kilometer, or 1000 meters, not 1-10th more than a thousand yards.† The quantities that are expressed in *acres* and *square miles* would also be expressed in *hectars* and *square kilometers*. The quantities that we denote by *cubic yards* would also be expressed in *cubic meters*. The *liter*, which is a somewhat smaller measure than our quart, and the *hectoliter* (100 liters or rather less than our sack of 3 bushels), with their decimals, would express the quantities that we measure by *quarts, gallons, bushels, quarters, hogsheads*. The *kiloliter*, or 1000 liters, is the equivalent of the *tun* of our old ale measure. The *kilogram* (the *weight* of a liter of water, nearly $2\frac{1}{2}$ lbs. avoirdupois,) the *quintal* (100 kilograms) and the *millier*, (1000 kilograms,) would denote all the quantities that we express in avoirdupois or troy pounds, hundreds, and tons.

If the quantities in the great summary tables were expressed in the national weights and measures, and in these conventionally international

* The following resolution passed unanimously:—"Le Congrès, considérant combien l'adoption pour toutes les nations d'un système uniforme de poids, mesures, et monnaies, faciliterait l'étude comparative des statistiques des divers pays, émet le vœu que ce système uniforme soit mis en vigueur."

† The *kilometer* is 1000 meters, and is 1093·633 yards. The meter is 1·093633 yard = 39·3709 inches. If meter and its compounds are used in English, they must evidently be written in English forms. I follow the analogy of *barometer*, *thermometer*.

The *hectar* is equal to 10000 square meters, or to a square of 100 meters to the side; the *acre* to a square of $22 \times \sqrt{10}$ yards = 69·5701 yards to the side. A hectar is nearly $2\frac{1}{2}$ acres, or more exactly 2·47114 acres.

The *liter* is in bulk equal to a cube, having the *tenth of a meter* to its side; the *weight* of a *liter* of distilled water (tem. 4° Centigrade) is a *kilogram*; and 1000 kilograms, that is the *weight* of 1000 *kiloliters* of water, is very nearly a *ton*. The 1000th part of a *ton* is 2·2400 lbs. avoirdupois, and a *kilogram* is 2·2046 lbs. The 1000th part of a *tun* of old ale measure is nearly one *liter*.

measures and weights, the use of all statistical returns would be greatly facilitated.

The *franc* is too small a *monetary unit* for a large proportion of the transactions of the present day. To express the large sums that figure in statistical tables in francs is attended with the same kind of inconvenience as to express the distance from London to Paris, or from town to town, in *yards* or *centimeters*. A *gold unit* must ultimately displace in national affairs the *silver franc*, which can only continue a subordinate counter*; but among the larger units in use the English *pound sterling* has the best claim to adoption. Its division into tenths (*dec.* or *florin*) and thousandths (*mil.*) gives all the subordinate units that are required; for the *cent* is not absolutely necessary. If the French Government will coin a 25-franc piece in gold it will very nearly correspond in value with the English “sovereign,”† and the correspondence in weight of pure gold might be made exact by a slight modification on both sides of the Channel. The coins would then stand thus, in three metals:—

	Unit	=	Sovereign or Louis-Napoleon.	Value in the present French Coins.
				francs. centimes.
<i>Gold:</i>	Pound	-	£1 0 f. 00 mils.	25·00
	Half-pound	-	5 f. 00 mils.	12·50
<i>Silver:</i>	Florin (the <i>tenth</i> of 1 <i>l.</i>)	-	1 f. 00 mils.	2·50
	Shilling	-	50 mils.	1·25
	Sixpence	-	25 mils.	·62½
	Franc	-	40 mils.	1·00
	Half-franc	-	20 mils.	·50
<i>Copper:</i>				
(Two Sols)	Penny	-	4 mils.	·10
(Sou)	Halfpenny	-	2 mils.	·05
(Mil)	Mil	-	1 mil.	·02½

Under this system the values of nearly all the existing coins in extensive use in England and France would be expressed in simple decimal divisions of the *pound sterling*, called in England a “sovereign” in France a “Louis-Napoleon.” And instead of £ *s. d.* we should write £ f. m., that is *pounds, florins, mils*, at the head of columns of accounts.

In silver the Spanish and the American dollars, the Romish scudo, the Austrian florin, the rupee, the Turkish and the Egyptian piastres, by slight changes could be made identical with the decimal divisions of the £1.

The English shilling would be precisely a *fifty-mil* piece; the sixpence a *twenty-five mil* piece; the penny a *four-mil* piece‡; the halfpenny a *two-mil* piece; the farthing a *one-mil* piece.

* Gold coin is displacing silver in France; and the Frenchman who would have carried *five-franc pieces* in his purse thirty years ago now carries Louis-Napoleons. In the reign of Charles X. gold of the value of rather more than 2,000,000*l.* and silver of the value of 25,000,000*l.* were coined. The Emperor Louis Napoleon has coined already nearly 13,000,000*l.* in gold, and little more than 3,300,000*l.* of silver.—Annuaire 1855, pub. par le Bureau des Longitudes, p. 110.

† The exchange at par is 25·225 francs to 1*l.*

‡ In nominal value the old *farthing*, *halfpenny*, and *penny* are 1–24th part more valuable than the *mil*.

The intrinsic value of the old coins differs now to a much greater extent; and no article in retail trade with which the poorer classes have to do is ever valued to this nicety. For them the *mil* would be the exact equivalent of the farthing; the *two-mil* of the halfpenny. The immense advantage derivable from the reduction of the compound rules of arithmetic to the simple cannot be obtained without some trouble; but upon the plan here sketched all the *gold and silver coinage* would remain in circulation, and no new

The French franc would be a *forty-mil* piece ; the sou a *two-mil* piece, exactly of the same value as the new English halfpenny, of which 25 would be change for a shilling,

Without awaiting, however, the identification of the coinage of the world, it will be actually sufficient for statistical purposes if each country, in addition to the quantities and values in its own weights, measures, and monies, publish the chief results in the *metrical weights* and *measures* and in the *pound sterling* and its decimal parts.

STATISTICAL BOARD.

In a small family, a small shop, or a small community, leading a simple life, where the persons, the property, and the transactions are well known to the governing head, no records are required for his information ; no accounts are kept. But if the family, the shop, or the township grows great,—if it expands into a vast establishment, a mercantile concern, or a state,—if it derives its income from various sources,—is engaged in a multitude of transactions,—employs a great variety of agents and powers in combination,—is opposed to rivals, in struggles for foreign possessions, for power, or for existence in its own territory,—a classified account of its stock, its condition, its transactions, its changes, and its forces becomes indispensable. Without it the house falls into confusion ; the operations of the mercantile concern are embarrassed at every step ; the state is ill-governed, paralyzed, or ruined.

Such an account of a State is called its Statistics, arranged so as to display its elements, exhibit their combinations, and elicit the laws which regulate its state or development.

The utility of statistics, after long experience, is universally felt ; and statistical inquiries are now instituted in every state of Europe, but not on a plan or a scale commensurate with the importance of the subject. This was the opinion of the Congress of Brussels ; and at Paris an able report of the second section was read by Baron Czoernig, suggesting the creation of a central statistical board in each country.*

The proposal met with the approbation of the practical men present, and received the full sanction of the Congress. In Belgium the statistics, which were in confusion, have been reduced by the central commission into a well-digested work, which is of the greatest use, and reflects glory on the administration of the enlightened sovereign of that kingdom.

In the British empire a board to plan and to digest the national statistics is more necessary than it is on the continent : the population is more numerous than it is in any continental empire, and it is diffused over a vast extent of territory, widely separated from the seat of government ; the occupations of the people are subdivided into innumerable branches ; the social condition and the economical transactions are varied and complicated ; the field of statistical inquiry is extensive and diversified, comprehending the numbers, passions, crimes, civil contests, education—the intellectual state—the marriages, the births, the deaths of men of many races, ranks, and occupations—besides the tenure of an immense amount of every variety of moveable and immoveable property, held under many complicated titles, and contributing in various proportions by rates and taxes to the parish, municipal, county, colonial, and national revenues.

silver coin would be required, although a *ten-mil* piece would probably be found convenient. The old copper halfpence and pence would be gradually displaced by *2-mil* pieces of the same size and value as the sou, 25 of which would be of the same value as a shilling, while 25 *four-mil* pieces, "*new pennies*," would be of the same value as a florin. See the admirable papers of Professor de Morgan on the Decimal Coinage.

* See *Moniteur*, 16th Sept. 1855, Doc. No. 4.

If it should be held, after a full consideration of the present extent of statistical inquiry, that the statistics of this country cannot be so well drawn up by one person or by one department as by the several existing departments acting in concert, and represented in a board, then some such arrangements as the following might be adopted, and would, I think, be found to work.

I shall not attempt here to suggest the outlines of a complete system of statistics for this country and its dependencies, but, taking the existing establishments, endeavour to point out how the special knowledge of different offices might be made available, while the whole may be organized so as to obtain the advantages of unity of design and uniformity of execution.

(1.) *Finance Statistics*.—The financial operations of this country are directed, controlled, and carried on chiefly by the Treasury, the Audit Board, the Paymaster-General, the Commissioners of National Debt, the Comptroller of the Exchequer, and the Master of the Mint. The annual accounts of the revenue, expenditure, debt, and stock of the nation should be thrown into a statistical form. A small statistical branch in one of these offices, perhaps the Treasury, would prepare the finance statistics, for the annual or periodical reports.

(2.) *Population and Health Statistics*.—The census of Great Britain for 1851 was taken by the Registrar-General for England, with the aid of two assistants and an additional staff of clerks. The census of Ireland was taken by the Registrar-General for Ireland and an assistant commissioner.

The census, the registration of births, deaths, and marriages, and all the other matters connected with the population and their occupations, could be conveniently dealt with in the

Office of the Registrar General of England.

" " " of Scotland.

" " " of Ireland.

(3.) *Sickness Statistics* would be a separate branch, to be reported on by the Board of Health, and the Registrar of Friendly Societies, in connection with the factory and mine inspectors.

The Commissioners in Lunacy would prepare a report on the lunatics and idiots of the kingdom.

(4.) *Poor Law and Friendly Society and Charity Statistics*.—This branch is connected with the two preceding, as infirmity and poverty are particular states of parts of the population. This special branch of statistics deals with the various degrees and causes of infirmity and of poverty; the amounts expended on relief of various kinds; the effects of such relief on the poor. Digests of the expenditure and records of the operation of charitable institutions and of almsgiving on the people may be prepared; and a particular account should be given of the friendly societies and other societies for affording succour to the working classes. A statistical branch of the Poor Law Board may be charged with this report.

(5.) *Statistics of Learning, Art, and Science*.—Periodical reports would exhibit the progress of education, literature, art, and science, in all our institutions, including in separate sections the several classes of schools, the athenæums, the universities, the learned societies, the British Museum and public libraries, the publication of books, periodicals, and newspapers. A small branch, in the Privy Council Office, might be charged to collect and digest all the information that can be obtained under this head.

(6.) *Church Statistics*.—A statistical account of the state and of the changes in the clergy, in the churches and chapels, and in the people

attending, may be prepared in the office of one of the Ecclesiastical Commissions.

(7.) *Judicial Statistics, Criminal and Civil.*—Reports and returns, as correct as can be procured, must be obtained, (1) of the *crimes committed*; (2) of the criminals detected, summarily convicted, or committed; of the decisions of justices of the peace, of stipendiary and other magistrates, of coroners' juries, of judges, in the several classes of courts; of the results of the trials; of the average time that the trials occupy; of the number and condition of each class of prisoners under sentence for each class of crime: and other circumstances illustrative of the causes and consequences of crime, would be comprehended in this report. The Bankruptcy and Insolvent courts, the County courts, the courts in which civil actions of every kind are tried, and the Chancery courts, would all contribute new and most important information.

A statistical branch at the *Home Office*, where Mr. S. Redgrave has laid the foundations of this branch of our statistics, could prepare the report, aided by the police, and the prison inspectors.

(8.) *Statistics of Trade, Commerce, Manufactures, and Agriculture.*—The extensive reports on the trade and commerce of the country would be prepared by the statistical department of the Board of Trade, with the assistance of the revenue departments.

Three new working sections in connection with this department are required, embracing —

(1.) Ways of communication (roads, railroads, canals, navigable rivers and seas.)

(2.) Agriculture.

(3.) Manufactures and industry generally.

The first section may be conducted in the office of the Inclosure Commissioners, which may be in communication with the Ordnance Map department and the officers of the Geological Survey. The last section may be dealt with in connection with the Census.

(9.) *Army Statistics.* The army reports should show its exact organization, civil and military; its classes, its annual recruits, its annual losses by battle, wounds, diseases, desertions, captures; its physical condition, its sickness, its punishments, its achievements as far as they can be expressed in numbers; a classified view of the articles in store (in the hands of the departments), of those supplied and destroyed in the year; the value and cost per man of all the important items of expenditure, well classified.

A section in the War Office would prepare these statistics. The Ordnance, the Royal Engineers, the Artillery, would, as separate classes, be included in the report. The ordnance supplies to the *Navy* would be written off, and would appear in the Navy report.

(10.) *Navy Statistics.*—The *Navy report* would be on the same plan as the Army report, presenting precise views of the state and changes of men, ships, dockyards, and establishments of every kind. The value and the annual expenditure of stores, ships, arms, men, would be analyzed. The marines would be treated in a separate section. The merchant seamen and the coast guard would be also reported on. A statistical branch of the Admiralty would draw up this report, reduce the tables, and perform the necessary calculations.

(11.) *Colonial Statistics.*—Some statistical forms are equally applicable to the United Kingdom and to the Colonies; others would be special. A statistical branch of the Colonial Office would draw up the report, reduce the facts in the colonial returns into tabular forms, and make the necessary calculations.

The Emigration Commissioners would co-operate with this branch of the Colonial Office and with the Registrars-General of the United Kingdom.

(12.) *Indian Statistics*.—Much valuable statistical information has been collected in India, and some of it has been published. In addition to the budget which is now brought before Parliament, a statistical account of that great portion of the British empire would be prepared by the statistical department of the India House.

(13.) *Foreign Statistics*.—A series of statistical returns would be sent home annually by the foreign ministers and consuls, which should be classified and analyzed at the statistical departments in England conversant with the several subjects, assisted by such comments and information as the Foreign Office could furnish.

The General Statistical Board might consist of—

- (1.) A president.
- (2.) A vice-president.
- (3.) The head of the statistical department of the Board of Trade and the heads of such other of the statistical departments as the Government might designate from time to time.
- (4.) A member nominated by the House of Lords.
- (5.) A member appointed by the Speaker of the House of Commons.
- (6.) A member nominated by the Statistical Society of London.
- (7.) Two members distinguished by their statistical and scientific works, nominated by Her Majesty's Government.
- (8.) A secretary and an assistant secretary.

The board might appoint special reporters annually on any of the several subjects; and thus every table would be explained and adequately discussed by competent men.

On some such plan as this the whole scheme of the statistics of the empire may be organized, so as to exhibit the principal facts and their relations to each other in a single volume. The more detailed statistical returns and reports of the several departments, as well as those called for by the Houses of Parliament and the Government, may be thrown into good well-considered forms, the trouble of consulting and using them being greatly diminished by the publication of the necessary calculations, with the "raw material," from which the results are derived.

Such a board, if the appointments were judiciously made, would carry out the objects which the two international Congresses held to be of great importance to all nations: it would prepare a body of statistics of immediate utility to our own country in the present day, and that would be studied with profit and interest by every successive generation of Englishmen. The preliminary labours, if *commenced now*, would enhance the utility of the next session of the Statistical Congress, which, after having been so well received in Brussels and in Paris, will, it is hoped, be next held in London.

CLASSIFICATION OF DISEASES.

In the most advanced nations of Europe the causes of every death are registered, and although large numbers of the people die everywhere without that medical aid which should "come to all," still such information is obtained as furnishes valuable evidences of the health of the people, or of the unwholesome and pestilential agencies which surround them. The Congress of Paris agreed to a nomenclature of the causes of death, essentially the same as that in use in England and Geneva. It adjourned to the next Congress the decision of the important question of statistical classification.

I submit to you the project which I have drawn up in order that it might be well considered with a view to a settlement at the next Congress.

The violent deaths in England were very imperfectly returned by the coroners when the first edition of the statistical nosology was framed, so that it was very often left uncertain whether deaths by drowning, by falls, by poison, and by other causes, were accidents, suicides, or homicides. Considerable improvement has since taken place in the coroner's inquest, and still further improvement may be expected when every inquest is attended by a medical man who has studied medical jurisprudence; so that we may hope to be able to fill in the abstract on the plan which I have now adopted, and which is in conformity with the views of my colleague Dr. D'Espine, and of our brethren generally on the continent.

I submit also, as an appendix to this Report, an inquiry into the ages and strength of the population of the Great Powers.

I beg to bring under your notice the cordial and the hospitable reception which the English received from the French minister, M. Rouher, from M. Rayer, from M. Villermé, and from other members of the French Commission. I have also to express my thanks especially to M. Legoyt, the talented secretary, for the assistance which he afforded me in various ways. It is my duty also to acknowledge friendly services which I received from all my colleagues.

I have the honor to be,

Sir,

Your very obedient Servant,

WILLIAM FARR.

The *Registrar General*.

THE GREAT POWERS.

(SUPPLEMENT to the REPORT on the Proceedings of the
STATISTICAL CONGRESS in Paris.)

There are seven Great Powers in the world.

England, France, Turkey, and Austria have existed as great powers for several centuries. Prussia, Russia, and the United States of America have entered this class within the last hundred years.

Spain was a great power: she has still a large, and not unwarlike population, which has from various causes been left behind in the career of progress by the powers that were her rivals in the sixteenth, seventeenth, and eighteenth centuries. Her population is, however, nearly equal to the population of Prussia, which is the smallest of the seven powers, and indeed has been raised into its present position, less by intrinsic greatness than by the military genius of its first kings and of its people. The power of Turkey has also declined.

None of the seven powers have colonies or foreign tributary territories, except France, which has Algeria, approaching France itself in extent, with a few dependencies in Asia, Africa, and America,—and Great Britain, whose colonies and dependencies are inhabited by, it is said, one hundred and sixty-two millions of people.

Among the secondary States, Holland, Spain, Portugal, and Denmark have extensive colonial possessions.

The Asiatic provinces of Russia, and the outlying states of America, stand in some respects in the same relations to the central powers of those two states as her colonies and tributary territories stand to England. They are not the elements but the results of power.

The aggressive and defensive powers of states are made up of many elements: the number of the men available for war is, next to the martial character of the people, one of the most important.

The annexed table, compiled from the best accessible sources, shows the total population, and the number of males and females in each state. The ages of the males are given from enumeration only in Great Britain, in France, in the United States, and in Prussia. The ages of the male populations of Austria and of Russia are deduced from the ages at death, or from other collateral facts which are described in the notes, and may be considered approximations that cannot be far from the truth. In determining the proportion of the sexes, and their ages, in Turkey, we have no assistance from any official source, and have been left to analogy and conjecture. The sexes and ages have been assumed to be in the same proportions as in Russia, which is the state to which Turkey, extending over the Danube, Asia Minor, Palestine, and Egypt, approximates now the most closely.

NINETY-SEVEN in every 100 men in the Prussian armies of the present day are *under forty years* of age, and in England the proportions are also *ninety-seven* in 100.

In the two armies that are recruited and maintained on such different principles, the proportional numbers of the age of 20 to 40 differ very little from 88 in 100; nearly 9 in 10 of the men are of that age; and with the navy, excluding the boys, the proportions of that age in the

British force are 85. The youths under 20 are little more than apprentices.

The effective armed forces of all nations are drawn almost exclusively from men of the athletic age 20-40; and it becomes therefore important to ascertain the stock of such men in each of the great states.

Upon referring to the *Table I.* it will be observed that the seven states comprise 239 millions of people, or near a fourth part of the population of the earth. The men of the military age (20-40), are *thirty-four millions five hundred and three thousand* in number; and the numbers in each State range from 2,535,891 in Prussia, to 9,127,414 in Russia.

The armies of France and Austria appear to amount to about 10 in 100 of the population of the military age in their respective states. England had not before the war, including the English forces in the East Indies, 4 in 100 of the men of the military age under arms in the army and navy.

With respect to the powers and confederates engaged in the present war, the states may be thus arranged.

Russia has NINE MILLIONS ONE HUNDRED AND TWENTY-SEVEN THOUSAND FOUR HUNDRED AND FOURTEEN men of the military age.

She is now engaged in war,

against England, that has FOUR MILLIONS ONE HUNDRED AND ELEVEN THOUSAND FOUR HUNDRED AND EIGHTY-ONE men of the military age;

against France, that has FIVE MILLIONS FIVE HUNDRED AND FORTY-ONE THOUSAND FOUR HUNDRED AND SIXTY-TWO men of the military age (making with the men of England NINE MILLIONS SIX HUNDRED AND FIFTY-TWO THOUSAND NINE HUNDRED AND FORTY-THREE,—numbers already superior to the Russians);

against Turkey, that has 4,784,490 men of the military age, making for the three allies a stock of 14,437,433 men of the military age, on which their armies and navies can draw to at least the extent of 10 per cent., or armies and navies of 1,443,743 Englishmen, Frenchmen, and Turks, to oppose 912,741 Russians.*

The addition of Austria to the alliance would raise the numbers to 1,968,004 against 912,741 Russians.

Russia has apparently for some years contemplated the seizure of the Turkish Empire, and if her schemes should be successful, she would rule over 13,911,904 men of the military age, a tenth part of whom, 1,391,190 would outnumber the tenth of the men of that age in England and France, and nearly equal the tenth of the men in England, France, and Austria (1,489,555).

THE INCREASE OF THE POWER OF ENGLAND.

The population of England has increased threefold since 1751, and at such a rate that to every million men in 1751, there were $1\frac{1}{2}$ millions in 1801, and 3 millions in 1851. In mere numbers the nation of 1851 is equivalent to *three* of the Englands of 1751.

The power of England has advanced more rapidly within the last century than the power of any other State in Europe; and the greatness of her power at the present time is concealed, rather than displayed, by the histories of past wars.

But it may be useful to show what the forces of England would now be if they bore the same proportion to the men of the military age (20-40), as the forces in the last war bore to the men of the corresponding age in 1811.

* These calculations were made, before Sardinia joined the Western Powers.

The power of England, it may be assumed, was tasked to the utmost in the war of 1803-15; and the force in the field and the expenditure, attained their maximum in 1814. The census was taken in 1811, and the force in that year may be taken to represent the military power which England wielded in that war.

The number of men in the army, navy, and merchant service was 640,500; and it is found from other returns that the military force was 501,488 men, leaving of the above 139,012 men in the merchant service.* In the military returns to Parliament the officers and the foreign force in the army are separately returned, but the foreign and colonial force in the navy has been estimated at 17,382;† and the officers of the army (15,424 in 1814, and about the same in 1811), have been distributed proportionally over the several corps.

The volunteers of infantry, artillery, and cavalry in 1803 amounted to 474,627, but the volunteers of 1811 (yeomanry, &c.) are not included in the forces of 1811 as above given. The army in India also included 30,253 Europeans, which, added to 471,235, make the regular English force 501,488, besides the native troops in the service of the East India Company, amounting to 182,838 regular troops, and 24,579 irregular troops, exclusive of invalids and pensioners (5875). The military forces of England, including the Indian armies, amounted to 709,067.

At the same time that England maintained these men on the seas, and in the field, she subsidized the continental armies, which in certain cases could only be moved by English gold.

The column 2. in the table III. shows the numbers and the composition of the English forces in 1811. The native forces were 17·2 per cent. of the men of the age 20-40; the Foreign and Colonial forces rose the proportion to 19·5, or nearly 1 to every 5 men of that age; 1 to every 36·5 of the population.

The column 3. shows the forces that have been recently *voted*, which in the aggregate amount to 451,893, or to a number *absolutely* only *one tenth part less* than the military force of 1811.

The column 4. shows, however, how much, as *compared with her power*, the levy should be greater than it was in 1811, before it bore the same proportion to the population and military power of the country.

The column 5. shows what an enormous force England will still have in reserve after the levies of column 3. are raised.

RECRUITS AND LOSSES OF THE MILITARY FORCE.

After the numbers of the military force are filled up; they are continually reduced by:—

- (1.) Deaths from disease and from wounds.
- (2.) The invaliding of men disabled by sickness and wounds.
- (3.) The expiration of terms of service, where the service term is limited.
- (4.) By desertion and losses, or the capture of prisoners by the enemy.

We have returns of the losses of the regular army in 1803-14, under three heads; and find that in the six last years of the war, including the Peninsular campaign, 12,356 died, 3,618 were invalided, and 4579 deserted

* 100,000 of the seamen in the merchant service were, it is said, foreigners. Census Enumeration 1811.

† It is known that there were foreigners in the navy; and it has been assumed, in the absence of data, that the proportions were the same as in the army.

annually, out of a mean force of 173,158.* So that the annual loss from these causes, which I presume include the four classes of causes above specified, amounts to nearly 12 per cent. (11·188) on the mean force.

And the regular army of 230,620 men now voted, if the losses were in the above ratio, would require 27,674 recruits annually. To sustain a regular army of 435,561 men and officers, 52,267 recruits would be required annually.

The loss of the navy by disease and wounds was at the rate of 4 men annually out of 100 living in the three years 1810–12; of whom 3·30 died on board, one half by disease, and one half by wounds; and about 0·7 died in hospitals. Of 70,000 seamen at the above rates, 2,800 would die annually.

If a force is kept stationary in numbers, the number of recruits depends upon the magnitude of the force, and on the rate of its losses.

The mortality of the *whole British army* was at the rate of 7·16 per cent. in the six years 1808–14; and the annual mortality of the troops in the Peninsular campaigns was 16 per cent. among privates, 10 per cent. among officers. Of the above, about 12 in 100 privates, 4 in 100 officers, died annually of disease; leaving 4 privates, 6 officers out of the same numbers, killed in battle, or dying of wounds. Of the men $22\frac{1}{2}$ in a 100 were constantly on the sick list.

The mortality in the general population of England, at the military age, notwithstanding the innumerable and evident defects in the sanatory arrangements of the towns, and the low living of considerable numbers, is less than 1 per cent. per annum.

The causes of the high mortality of the army can be exactly ascertained by investigation; and arrangements could be made for supplying all that is necessary to preserve their health, except in times of disastrous defeat. The amount of desertion and invaliding would at the same time be diminished†.

Under the system of limited terms of service, the number of men who leave every year will be increased‡; but this result may be greatly counteracted by increasing the good-service pay after 7 years; and again after 14 years service, thus retaining the services of the best men until they are 45 years of age.

EXPENSE OF THE MILITARY FORCE.

The sums expended in 1811 were:—

For the army	-	-	-	-	£29,160,530
„ the ordnance	-	-	-	-	4,495,816
„ the navy	-	-	-	-	19,202,679
					£52,859,025
Subsidies for Portugal, Spain, Sicily					- £2,367,413 §

The military and naval forces, exclusive of the force of 30,253 in the East Indies, were 471,235; so that each man was kept in the service at the rate of nearly 112*l.* a year in the currency of that year.

* The numbers are given in detail in the “*Force Militaire*,” vol. i. p. 240. By Baron C. Dupin. See also Sir Gilbert Blane’s works for the naval losses. Mr. Hodge is preparing a valuable paper on the mortality of the army, in which he has revised all these numbers.

† The mortality among the Dorchester labourers of the age 20–40 is less than 1 per cent., so that luxuries are not necessary in the sanatory sense.

‡ These numbers can be calculated if the necessary data are supplied.

§ Porter’s Progress of the Nation. Ed. 1851, pp. 505–7.

The number of men in the navy was 136,778 ; the supply for the navy was 19,202,679*l.* ; or the sum expended per man was 140·39*l.*

Including the whole of the ordnance supply and force, the vote on the army of 334,457 men (exclusive of India) was at the rate of 100·63*l.* per man.

To obtain the true proportions, the army expenditure should be decreased, the navy expenditure increased, by a certain portion of the ordnance supply.

The supply of 46,558,462*l.* voted in 1811 was inadequate ; for the expenditure on the army, navy, and ordnance was stated in the subsequent accounts to be 52,859,025*l.*, and on the average of the three years 1810-12, it was 52,447,779*l.* Using this sum, and reducing the value in depreciated currency to its value in gold (45,385,000*l.*)* the annual expenditure on each man in the army and navy was 96·311*l.* ; and the expenditure in the navy per man was, to that in the army, in the proportion of about 3 to 2.

The accounts were involved in technical obscurity ; the checks and counter-checks grew also so numerous that there was at last no effectual audit, and the check of statistical arrangement was absent ; but if we consider the additional expenses of steam power and of mechanical agencies, and of necessary improvements in the treatment of the soldier and of the sailor, it will not be safe to assume, that when a large proportion of the military force of the country is engaged in actual warfare, the actual annual expenditure will be less than 100*l.* per man.† The army and navy in war will require an expenditure at the rate of *ten million pounds* a year on every 100,000 officers and men. A small proportion only of this sum is expended in pay.

The true policy in the conduct of the war is then to engage the best officers and men that can be obtained, at any rate of pay that may be necessary ; and to employ no more of these efficient men than the circumstances require.

The glory as well as the interests of England will thus be most effectually sustained.

DEBTS OF THE SEVEN GREAT POWERS.

The annual produce of the United Kingdom is about *four hundred million pounds*, and the value of the property by which it is produced is about *tent housand million pounds*.‡

The property of the country has since the last war increased more rapidly than the population, and while the debts of several of the other great states have increased the debt of England has been reduced.

Austria has nearly doubled her debt within the last 5 years ; and is financially disabled. With half the income she has an army equal in numbers to the army of France.

* The price of an ounce of gold was 4·500*l.* in the inconvertible bank note currency of 1811 ; it is now worth 3·894*l.* nearly in our convertible currency.

† The expenditure in 1851, under the head of army, navy, and ordnance supplies, was 14,873,838*l.* on the force of the country, which was exclusive of 29,096 men in the East Indies, 149,677 men ; or 99·378*l.* per man. Our ordnance supplies mix up the expenditure on the army and navy stores, so that it is difficult to allot to the sea and land forces their exact share of the aggregate ordnance supply.

‡ See some of the details of this estimate in "Income Tax Inquiry," evidence of W. Farr.

STATES.	Year.	Debt towards the close of the last war.	Debt in 1853.
		£	£
AUSTRIA - -	(1816)	63,000,000	211,635,000
FRANCE - -	(1814)	50,000,000	233,000,000
RUSSIA - -	(1817)	30,000,000	68,000,000
ENGLAND - -	(1817)	864,000,000*	779,365,204*

The following is a Table of the Public Debt, of the reported income, and of the expenditure of the Seven Great Powers *before the war*. Russia furnishes no returns of her income and expenditure, but they may no doubt be ascertained. Turkey, Austria, and Russia have also large outstanding liabilities in the form of depreciated paper money; the most dangerous and ruinous of all forms of forced loans.

STATES.	Debt.	Income.	Expenditure.
ENGLAND (1853) - -	779,365,204	56,834,711	54,002,995
FRANCE (1853) - -	233,000,000	56,980,776	58,117,192
TURKEY (1841) - -	5,000,000	6,645,450	6,667,269
AUSTRIA (1854) - -	211,635,000	27,100,000	36,600,000
PRUSSIA (1853) - -	31,205,836	14,105,576	14,595,870
RUSSIA (1854) - -	68,000,000	?	?
UNITED STATES OF AMERICA (1854)	10,000,000	8,000,000	8,450,257

The degrees of credit of the different states are represented by the value of the public securities; thus a perpetual annuity of 1*l.* a year is more or less valuable in proportion to the chance there is of its being or of its not being punctually paid.

Price of Public Securities.

		£	s.
ENGLISH, 3 per cent. Consols 93½	} The promise of <i>England</i> to pay 1 <i>l.</i> a year in per- petuity is worth in the best market	31	2
FRENCH, 3 per cents. 69·75		23	2
RUSSIAN, 4½ per cents. 91·0	} The same promise by <i>Russia</i> is worth	20	0
AUSTRIAN, 5 per cents. 68½		13	7
TURKISH, 6 per cents. 80¼	} The same promise by <i>Turkey</i> is worth	13	4

Since these calculations were made, the value of the several securities have undergone many changes, and vary from day to day, without diminishing the relative superiority of the credit of England.

W. FARR.

* This sum is exclusive of the various terminable annuities.

TABLE I. — POPULATION of SEVEN GREAT STATES, distinguishing the Ages of Males of the Military Age (20–40).

States.	Persons.	Total Females.	Total Males.	Men of the Military Age 20–40.	Amount of a Levy of One in Ten Men of the Age 20–40.
TOTAL - - -	239,230,607	120,375,043	118,855,564	34,503,377	3,450,337
ENGLAND - - - - 1851	27,825,274	14,137,729	13,687,545	4,111,481	411,148
FRANCE - - - - 1851	35,783,170	17,988,206	17,794,964	5,541,462	554,146
TURKEY - - - - 1844	35,350,000	17,816,876	17,533,124	4,784,490	478,449
AUSTRIA - - - - 1840	36,950,401	18,747,770	18,202,631	5,242,611	524,261
PRUSSIA - - - - 1849	16,331,187	8,168,382	8,162,805	2,535,891	253,589
RUSSIA - - - - 1855	67,437,507	33,989,414	33,448,093	9,127,414	912,741
UNITED STATES OF AMERICA - 1850	19,553,068	9,526,666	10,026,402	3,160,028	316,003

The actual health and vigour of the respective races are represented by the mean mortality and the mean lifetime ; in both these respects England and France stand the first, Russia last, of the States from which data can be obtained :

Annual Mortality.		
England	1 in 45
France	1 in 42
Prussia	1 in 38
Austria	1 in 33
Russia	1 in 28

	TOTAL -	118,855,564	57,600,852	34,503,377	19,337,872	7,413,463	

NOTES.

- (a) ENGLAND (exclusive of Ireland). The population for the middle of the year 1851, was taken from the Census Report, page cliv.
- (a) IRELAND. The population for Ireland is that enumerated in 1851, and the males whose ages were not returned have been distributed proportionally over the several ages. The army stationed in Ireland (26272) was not enumerated with the general population, but it has been included in the above table; as also has (49704), the proportion of the army, navy, and merchant seamen belonging to Ireland, who were abroad in 1851: their ages have been estimated from the army and navy returns for Great Britain. 3596 boys, belonging to the army, have been added to the enumerated population, and they were obtained by assuming that they bore the same proportion to the army as in 1841.
- (b) FRANCE. The number of males given in the above table is that returned in 1851. 17952 males, whose ages were not returned, have been distributed proportionally over each of the ages given in this table.
- (c) TURKEY. This is the population in 1844 nearly as given by Ubicini and in the Almanach de Gotha of 1855; no details as to age or sex are given, but for the present statement it has been assumed that the numbers of males at different ages are in the same relative proportions as are here given for Russia.
- (d) AUSTRIA. This population is taken from the official returns furnished to the Registrar General, and published in his sixth annual Report (pp. 329-44), for the year 1840. The ages were not stated; but for the year 1837 the proportional numbers *under* and *above* 20 were recorded, and these proportions have here been applied to the population of 1840, and in addition, the males living at *each* respective vicennial period over the age of 20 have been derived by assuming that they were in the same proportions as are found in the returns for Sweden in 1835 (*see* Registrar General's sixth Report, page 270). The total population in 1850-51 given in the Almanach de Gotha of 1855, is 36,514,466, while the official number given for 1840 is 36,950,401. In the official returns of 1855 (*Mittheilungen aus dem Gebiete der Statistik*: 4^{ter} Jahrgang. 2 Heft.) pp. 8-9, it is stated, that the population as last enumerated in 1850 was 35,750,621; comprising 17,437,068 males, and 18,313,553 females. It is estimated from the rates of increase in 1840-6, that the population at the end of 1854 amounted to 37,356,699. But this number is also said to be defective; and it is inferred from the Conscription returns that 5 or 6 per cent of the population are unenumerated. Upon this assumption the estimated population of the empire is set down at 39,411,309; the males being 19,272,610, and the females 20,138,699.

Until a more accurate census is taken by the new Statistical Board I think the numbers in the above table most suitable for the purposes of comparison with the similar returns of other states.

- (e) PRUSSIA. The above population of Prussia is taken from the official returns published for the year 1849; the numbers are therein grouped in periods of age which do not in one or two instances exactly correspond with the ages in the present Table; but in such cases by adding or deducting proportional numbers the result obtained cannot differ materially from the true numbers.
- (f) RUSSIA. The population is derived from the official returns received by the Registrar General, and published in his sixth annual Report (pp. 315-28), where the population is stated for the year 1842, and comprises European and Asiatic Russia. The sex of 15,334,210 persons ($\begin{smallmatrix} 25,461,077 \text{ males} \\ 25,873,133 \text{ females} \end{smallmatrix}$) out of 59,254,771 living in 1842, is recorded, and the males and females of the remainder are assumed to be in the same relative proportions. For the present statement the population has been estimated for 1855 on the assumption of Tegoborski that the *annual rate* of increase since 1842 has been one per cent. The ages of the living are not recorded, and they have been here obtained from the *deaths at different ages* given in the 1834, official returns for the two years 1832 and 1834; for on taking the *rate of mortality* to be the same as in Manchester (to which rate it approximates in the aggregate), the numbers thus obtained were found to be a little in excess of the given total: they have accordingly been proportionally reduced.

- (g) UNITED STATES. The population has been derived from the Census of the United States in 1850. The number is exclusive of the free and slave coloured population, which amounted to 3,634,830 (1,809,238 males 1,825,592 females.) 7,153 males, whose ages were not stated, have been distributed proportionally over the several ages given in the table. The number of coloured males at the above ages were :—

Ages.		Males.
0—20	=	1,009,481
20—40	=	526,830
40—60	=	204,376
60—80	=	60,817
80 and upwards		7,734

[The following Index furnishes a reference to the *Number* of each DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report, the numbers running consecutively from 1 to 623.* In forming the alphabetical arrangement the principle is adopted of placing compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A, as Ashford, East.]
